

Motion Capture

© Michiel van de Panne

Data Acquisition

- mechanical
 - *joint angles*
- electromagnetic
 - *6 DOF sensors*

© Michiel van de Panne

Data Acquisition (cont)

- active optical systems
 - *self-identifying markers*
- passive optical systems

iel van de Panne

Data Acquisition (cont)

- building a skeleton
 - *joint locations, limb lengths*
- from marker positions to joint angles
- data cleanup

© Michiel van de Panne

Editing Mocap Data

- map onto a new character
 - e.g., character that is larger than actor
- change the motion
 - e.g., walk with larger steps, higher jump
- take physics into account?
- maintaining constraints
 - footskate cleanup
- mirroring and transplanting limbs

© Michiel van de Panne

Using Mocap Data

- continuous motion spaces
 - e.g., walk(speed, turning rate)
- discrete motion spaces
 - e.g., motion graphs from motion capture soup
 - e.g., designed motion trees for games
 - when can we transition btwn two motions?
 - what should the blend time be?
 - which motions to add?

© Michiel van de Panne

Using Mocap Data (cont)

- planning in discrete and continuous motion spaces
- UIs for using discrete and continuous motion spaces
- abstracting motion style

© Michiel van de Panne

Limitations of mocap

- **can never have enough motion data !**
- complex interactions with the environment,
 - e.g., tripping over a box; colliding football players
- motion done in the context of an environment and this context is not captured
 - e.g., objects, other people
- motions can be composed
 - e.g., can walk and scratch one's head
- motion can have huge variation and expressiveness
 - e.g., acting, dancing, particular walk
 - e.g., facial animation
- not a predictive model
