Chapter 12

Texture Mapping

The Rendering Pipeline

Texture Mapping

- Real life objects non uniform in terms of color & normal
- To generate realistic objects - reproduce coloring & normal variations = **Texture**
- Can often replace complex geometric details

Texture Mapping

- increase realism
 - lighting/shading models not enough
- hide geometric simplicity
 - images convey illusion of geometry
 - map a brick wall texture on a flat polygon
 - create bumpy effect on surface
- associate 2D information with 3D surface
 - point on surface corresponds to a point in texture
 - “paint” image onto polygon

Color Texture Mapping

- Define color (RGB) for each point on object surface
- Two approaches
 - Surface texture map
 - Volumetric texture

Surface texture

- Define texture pattern over (u,v) domain (Image)
 - Image – 2D array of “texels”
- Assign (u,v) coordinates to each point on object surface
- For free-form – use inverse of surface function
- For polygons (triangle)
 - Inside – use barycentric coordinates
 - For vertices need mapping function

Texture Mapping

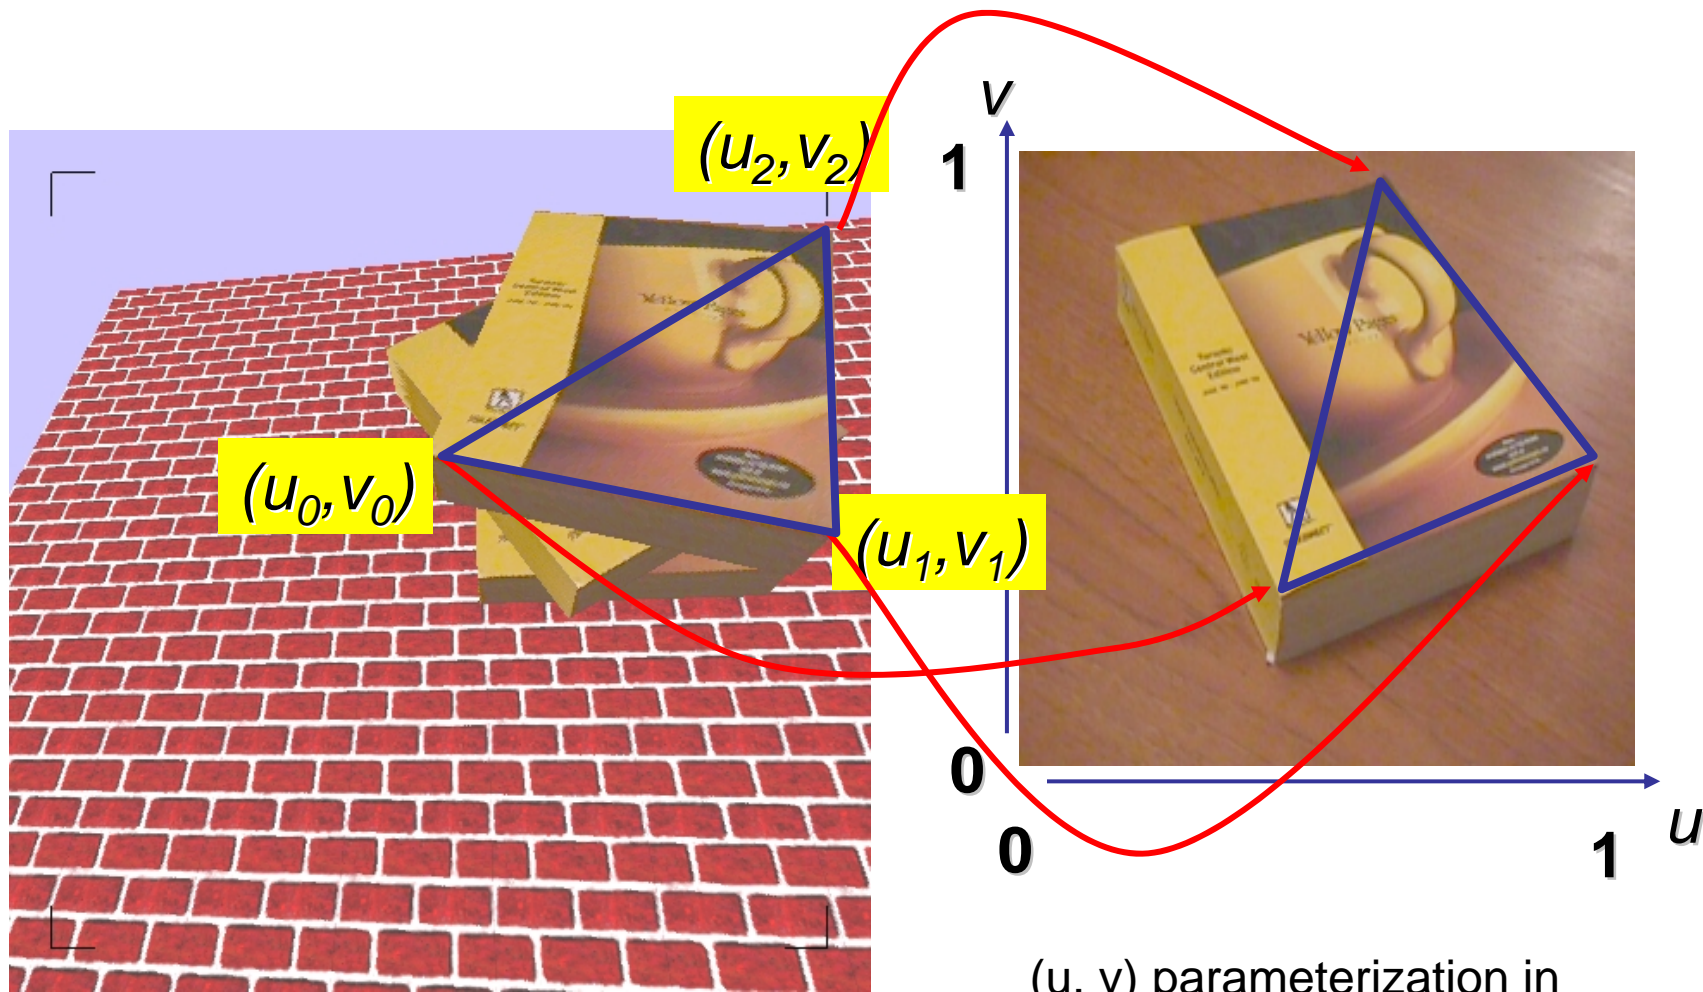

Mapping for Triangular Meshes

- Mapping defined by:
 - Vertices (3D) mapped to specified (u,v) locations in 2D
 - Each interior point mapped to 2D using barycentric coordinates

Texture Mapping

Example Texture Map

- Associate (u,v) with each vertex
 - Not necessarily same proportions as (x,y,z)

Applied to polygon

Texture Coordinates

- every polygon has object coordinates and texture coordinates
 - object coordinates describe where polygon vertices are on the screen
 - texture coordinates describe texel coordinates of each vertex
 - texture coordinates are interpolated along vertex-vertex edges
- `glTexCoord2f(TYPE coords)`
 - Other versions for different texture dimensions

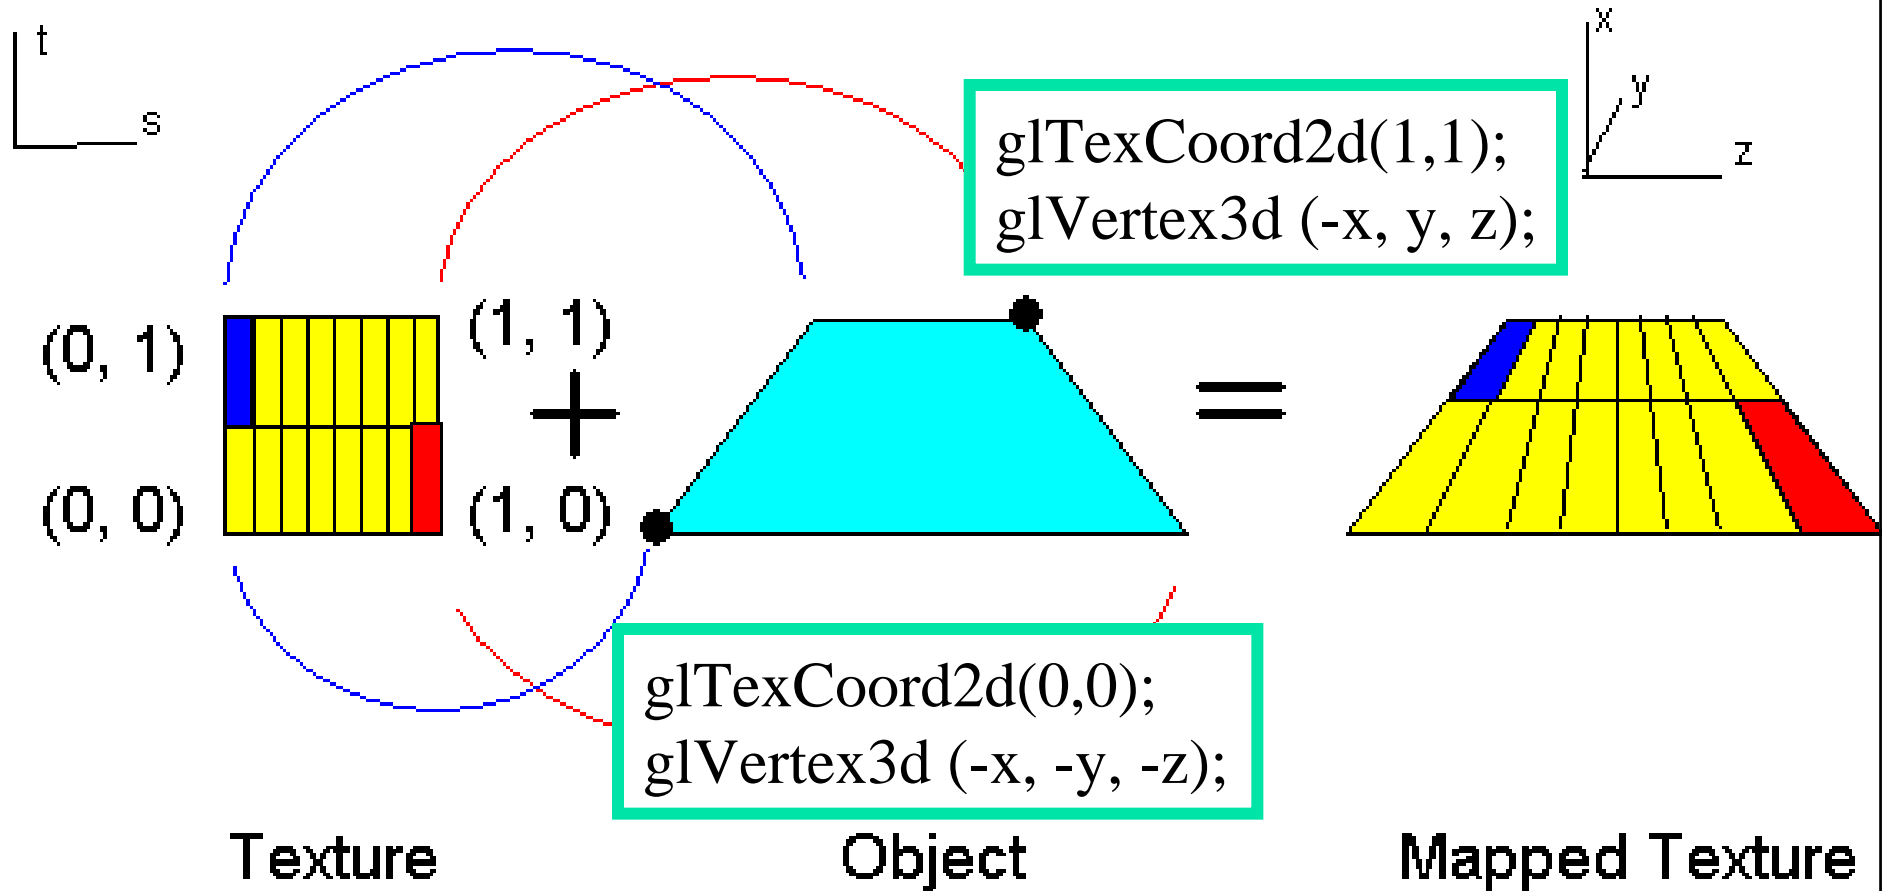

Texture Mapping - OpenGL

- Texture Coordinates
 - Generation/storage at vertices
 - specified by programmer or artist
 - `glTexCoord2f(s,t)`
 - `glVertexf(x,y,z)`
 - generate as a function of vertex coords
 - interpolated across triangle (like R,G,B,Z)
(well, not quite...)

Example Texture Map

Example Texture Map

```
glTexCoord2d(4, 4);  
glVertex3d (x, y, z);
```

```
glTexCoord2d(1, 1);  
glVertex3d (x, y, z);
```

Texture Lookup

■ issue:

- what happens to fragments with u or v outside the interval $[0...1]$?

multiple choices:

- cyclic repetition of texture to tile whole surface

*glTexParameteri(..., GL_TEXTURE_WRAP_S,
GL_REPEAT)*

- clamp every component to range $[0...1]$ - re-use color values from border of texture image

*glTexParameteri(..., GL_TEXTURE_WRAP_S,
GL_CLAMP)*

Texture Functions

- once have value from the texture map, can:
 - directly use as surface color: `GL_REPLACE`
 - throw away old color, lose lighting effects
 - modulate surface color: `GL_MODULATE`
 - multiply old color by new value, keep lighting info
 - texturing happens **after** lighting, not relit
 - use as surface color, modulate alpha: `GL_DECAL`
 - like replace, but supports texture transparency
 - blend surface color with another: `GL_BLEND`
 - new value controls which of 2 colors to use
 - indirection, new value not used directly for coloring

Texture Mapping

- Texture coordinate interpolation
 - Perspective foreshortening problem
 - Also problematic for color interpolation, etc.

Perspective - Reminder

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & \frac{d}{d-\alpha} & \frac{-\alpha d}{d-\alpha} \\ 0 & 0 & \frac{1}{d} & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x \\ y \\ (z-\alpha)d/(d-\alpha) \\ z/d \end{bmatrix} \quad \begin{bmatrix} x_p \\ y_p \\ z_p \end{bmatrix} = \begin{bmatrix} \frac{x}{z/d} \\ \frac{y}{z/d} \\ \frac{d^2}{d-\alpha} \left(1 - \frac{\alpha}{z} \right) \end{bmatrix}$$

- Preserves order
 - BUT distorts distances

Texture Coordinate Interpolation

■ Perspective Correct Interpolation

- α, β, γ :

Barycentric coordinates of point **P**

- u_0, u_1, u_2 : texture coordinates of vertices
- w_0, w_1, w_2 : homogenous coordinate of vertices

$$u = \frac{\alpha \cdot u_0 / w_0 + \beta \cdot u_1 / w_1 + \gamma \cdot u_2 / w_2}{\alpha / w_0 + \beta / w_1 + \gamma / w_2}$$

- Similarly for v

Reconstruction

University of
British Columbia

(image courtesy of Kiriakos Kutulakos, U Rochester)

Reconstruction

- How to deal with:
 - pixels that are much larger than texels ?
(apply filtering, "averaging")

- pixels that are much smaller than texels ?
(interpolate)

MIP-mapping

Use “image pyramid” to precompute averaged versions of the texture

Without MIP-mapping

With MIP-mapping

MIP-mapping

without

with

Volumetric Texture

- Define texture pattern over 3D domain - 3D space containing the object
 - Texture function can be digitized or **procedural**
 - For each point on object compute texture from point location in space
- Common for natural material/irregular textures (stone, wood, etc...)

Principles

- 3D function ρ
 - $\rho = \rho(x, y, z)$
- Texture Space – 3D space that holds the texture (discrete or continuous)
- Rendering: for each rendered point $P(x, y, z)$ compute $\rho(x, y, z)$
- Volumetric texture mapping function/space transformed with objects

Effects

- Boring Marble
 - `function boring_marble(point)`
 `x = point.x;`
 `return marble_color(sin(x));`
 // marble_color maps scalars to colors
- Bombing
 - Randomly drop bombs of various shapes, sizes and orientation into texture space (store data in table)
 - For point P search table and determine if inside shape
 - if so, color by shape

Effects (cont.)

- Otherwise, color by objects color
- Example:

Function Noise

- Noise – return scalar for each $P(x,y,z)$
- Defined as:
 - Initially, for each x,y,z in Z ($x, y, z \in \mathbb{N}$):
 $H(x,y,z) = d$ (d - randomly chosen value)
 - Retrieval:
 - If (x,y,z) are all integers:
 - $\text{Noise}(x,y,z) = H(x,y,z)$
 - Otherwise:
 - $\text{Noise}(x,y,z) = \text{interpolation of neighboring } H(x,y,z)$

Function Noise (cont.)

Function Turbulence

```
function turbulence(p)
  t = 0;
  scale = 1;
  while (scale > pixelsize) {
    t += abs(Noise(p/scale)*scale);
    scale/=2;
  }
  return t;
```

More Effects

- Marble effect (using turbulence):

```
function marble(point)
```

```
  x = point.x + turbulence(point);
```

```
  return marble_color(sin(x))
```

Texture Parameters

- In addition to color can control other material/object properties
 - Reflectance (either diffuse or specular)
 - Surface normal (bump mapping)
 - Transparency
 - Reflected color (environment mapping)

Normal – Bump Mapping

- Object surface often not smooth
 - to recreate correctly need complex geometry model
- Can control shape “effect” by locally perturbing surface normal
 - Random perturbation
 - Directional change over region

Bump Mapping

$O(u)$

Original surface

$B(u)$

A bump map

Bump Mapping

$O'(u)$

Lengthening or shortening
 $O(u)$ using $B(u)$

$N'(u)$

The vectors to the
'new' surface

Environment Mapping

- cheap way to achieve reflective effect
 - generate image of surrounding
 - map to object as texture

Environment Mapping

- used to model object that reflects surrounding textures to the eye
 - movie example: cyborg in Terminator 2
- different approaches
 - sphere, cube most popular
 - OpenGL support
 - GL_SPHERE_MAP, GL_CUBE_MAP
 - others possible too

Cube Mapping

- 6 planar textures, sides of cube
 - point camera in 6 different directions, facing out from origin

Cube Mapping

University of
British Columbia

Sphere Mapping

- texture is distorted fish-eye view
 - point camera at mirrored sphere
 - spherical texture mapping creates texture coordinates that correctly index into this texture map
