Modeling and Viewing Transformation

Affine transformations

- Linear transformations + translations
- Can be expressed as a 3x3 matrix + 3 vector

$$\mathbf{x}' = \mathbf{M} \cdot \mathbf{x} + \mathbf{t}$$

© Wolfgang Heidrich

Scaling

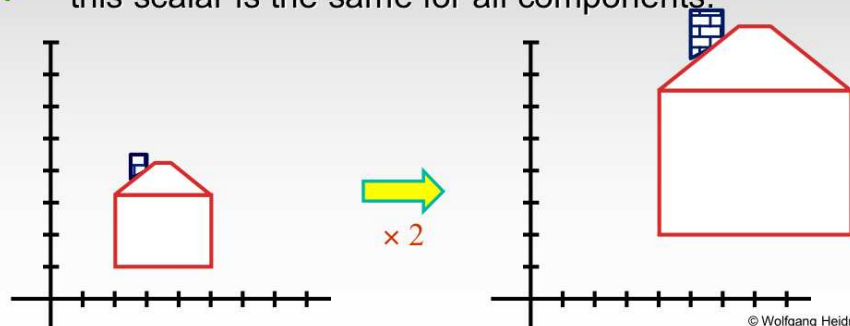

Scaling

- a coordinate means multiplying each of its components by a scalar

Uniform scaling

- this scalar is the same for all components:

© Wolfgang Heidrich

Scaling

Non-uniform scaling:

- different scalars per component:

how can we represent this in matrix form?

Scaling (2D)

scaling operation:
$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} ax \\ by \end{pmatrix}$$

or, in matrix form:
$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \underbrace{\begin{pmatrix} a & 0 \\ 0 & b \end{pmatrix}}_{\text{scaling matrix}} \cdot \begin{pmatrix} x \\ y \end{pmatrix}$$

Scaling (3D)

scaling operation:

$$\begin{pmatrix} x' \\ y' \\ z' \end{pmatrix} = \begin{pmatrix} ax \\ by \\ cz \end{pmatrix}$$

or, in matrix form:

$$\begin{pmatrix} x' \\ y' \\ z' \end{pmatrix} = \begin{pmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{pmatrix} \cdot \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

© Wolfgang Heidrich

2D Rotation From Trig Identities

$$x = r \cos(\phi)$$

$$y = r \sin(\phi)$$

$$x' = r \cos(\phi + \theta)$$

$$y' = r \sin(\phi + \theta)$$

Trig Identity...

$$x' = r \cos(\phi) \cos(\theta) - r \sin(\phi) \sin(\theta)$$

$$y' = r \sin(\phi) \cos(\theta) + r \cos(\phi) \sin(\theta)$$

Substitute...

$$x' = x \cos(\theta) - y \sin(\theta)$$

$$y' = x \sin(\theta) + y \cos(\theta)$$

© Wolfgang Heidrich

2D Rotation Matrix

Easy to capture in matrix form:

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} \cos(\theta) & -\sin(\theta) \\ \sin(\theta) & \cos(\theta) \end{pmatrix} \cdot \begin{pmatrix} x \\ y \end{pmatrix}$$

Even though $\sin(\theta)$ and $\cos(\theta)$ are nonlinear functions of θ ,

- x' is a linear combination of x and y
- y' is a linear combination of x and y

© Wolfgang Heidrich

3D Rotation

- About x axis:
$$\begin{pmatrix} x' \\ y' \\ z' \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos(\theta) & -\sin(\theta) \\ 0 & \sin(\theta) & \cos(\theta) \end{pmatrix} \cdot \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$
- About y axis:
$$\begin{pmatrix} x' \\ y' \\ z' \end{pmatrix} = \begin{pmatrix} \cos(\theta) & 0 & \sin(\theta) \\ 0 & 1 & 0 \\ -\sin(\theta) & 0 & \cos(\theta) \end{pmatrix} \cdot \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$
- About z axis:
$$\begin{pmatrix} x' \\ y' \\ z' \end{pmatrix} = \begin{pmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{pmatrix} \cdot \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

© Wolfgang Heidrich

Shear

Shear along x axis

- push points to right in proportion to height

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} ? & ? \\ ? & ? \end{pmatrix} \cdot \begin{pmatrix} x \\ y \end{pmatrix}$$

© Wolfgang Heidrich

Shear

Shear along x axis

- push points to right in proportion to height

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} 1 & sh_x \\ 0 & 1 \end{pmatrix} \cdot \begin{pmatrix} x \\ y \end{pmatrix}$$

© Wolfgang Heidrich

Reflection

Reflect across x axis

- Mirror

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} ? & ? \\ ? & ? \end{pmatrix} \cdot \begin{pmatrix} x \\ y \end{pmatrix}$$

© Wolfgang Heidrich

Reflection

Reflect across x axis

- Mirror

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \cdot \begin{pmatrix} x \\ y \end{pmatrix}$$

© Wolfgang Heidrich

Affine Transformations

Translation:

- Add a constant (2D or 3D) vector:

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \cdot \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} t_x \\ t_y \end{pmatrix}$$

Compositing of Linear and Affine Transformations

Example: 3D rotation around arbitrary axis

- Rotate axis to z-axis
- Rotate by ϕ around z-axis
- Rotate z-axis back to original axis
- Composite transformation:

$$\begin{aligned} R(v, \phi) &= R_z^{-1}(\alpha) \cdot R_y^{-1}(\beta) \cdot R_z(\phi) \cdot R_y(\beta) \cdot R_z(\alpha) \\ &= (R_y(\beta) \cdot R_z(\alpha))^{-1} \cdot R_z(\phi) \cdot (R_y(\beta) \cdot R_z(\alpha)) \end{aligned}$$

Compositing of Linear and Affine Transformations

In general:

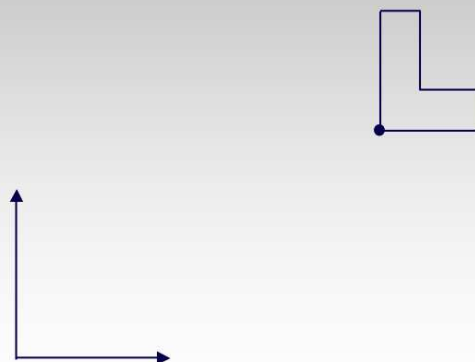

- Transformation of geometry into coordinate system where operation becomes simpler
- Perform operation
- Transform geometry back to original coordinate system

© Wolfgang Heidrich

Compositing of Affine Transformations

Example: Rotation around arbitrary center

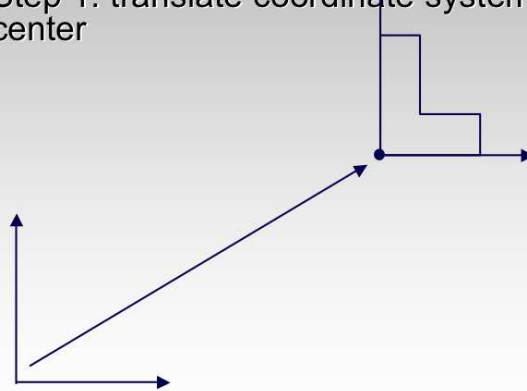

© Wolfgang Heidrich

Compositing of Affine Transformations

Example: Rotation around arbitrary center

- Step 1: translate coordinate system to rotation center

© Wolfgang Heidrich

Compositing of Affine Transformations

Example: Rotation around arbitrary center

- Step 2: perform rotation

© Wolfgang Heidrich

Compositing of Affine Transformations

Example: Rotation around arbitrary center

- Step 3: back to original coordinate system

© Wolfgang Heidrich

Compositing of Affine Transformations

Composite transformation:

- Is again an affine transformation

$$\begin{aligned} \mathbf{x}' &= \mathbf{Id} \cdot (R(\phi) \cdot (\mathbf{Id} \cdot \mathbf{x} + \mathbf{t})) - \mathbf{t} \\ &= \mathbf{Id} \cdot (R(\phi) \cdot \mathbf{x} + R(\phi) \cdot \mathbf{t}) - \mathbf{t} \\ &= R(\phi) \cdot \mathbf{x} + (R(\phi) \cdot \mathbf{t} - \mathbf{t}) \\ &= R(\phi) \cdot \mathbf{x} + \mathbf{t}' \end{aligned}$$

© Wolfgang Heidrich

Properties of Affine Transformations

Definition:

- A *linear combination* of points or vectors is given as

$$\mathbf{x} = \sum_{i=1}^n a_i \cdot \mathbf{x}_i, \text{ for } a_i \in \mathfrak{R}$$

- An *affine combination* of points or vectors is given as

$$\mathbf{x} = \sum_{i=1}^n a_i \cdot \mathbf{x}_i, \text{ with } \sum_{i=1}^n a_i = 1$$

© Wolfgang Heidrich

Properties of Affine Transformations

Example:

- Affine combination of 2 points

$$\begin{aligned} \mathbf{x} &= a_1 \cdot \mathbf{x}_1 + a_2 \cdot \mathbf{x}_2, \text{ with } a_1 + a_2 = 1 \\ &= (1 - a_2) \cdot \mathbf{x}_1 + a_2 \cdot \mathbf{x}_2 \\ &= \mathbf{x}_1 + a_2 \cdot (\mathbf{x}_2 - \mathbf{x}_1) \end{aligned}$$

© Wolfgang Heidrich

Properties of Affine Transformations

Definition:

- A convex combination is an affine combination where all the weights a_i are positive
- Note: this implies $0 \leq a_i \leq 1, i=1 \dots n$

© Wolfgang Heidrich

Properties of Affine Transformations

Example:

- Convex combination of 3 points

$$\mathbf{x} = \alpha \cdot \mathbf{x}_1 + \beta \cdot \mathbf{x}_2 + \gamma \cdot \mathbf{x}_3$$

$$\text{with } \alpha + \beta + \gamma = 1, 0 \leq \alpha, \beta, \gamma \leq 1$$

- $\alpha, \beta,$ and γ are called *barycentric coordinates*

© Wolfgang Heidrich

Properties of Affine Transformations

Theorem:

- The following statements are synonymous

- A transformation $T(x)$ is affine, i.e.:

$$\mathbf{x}' = T(\mathbf{x}) := \mathbf{M} \cdot \mathbf{x} + \mathbf{t},$$

for some matrix \mathbf{M} and vector \mathbf{t}

- $T(x)$ preserves affine combinations, i.e.

$$T\left(\sum_{i=1}^n a_i \cdot \mathbf{x}_i\right) = \sum_{i=1}^n a_i \cdot T(\mathbf{x}_i), \text{ for } \sum_{i=1}^n a_i = 1$$

- $T(x)$ maps parallel lines to parallel lines

© Wolfgang Heidrich

Properties of Affine Transformations

Preservation of affine combinations:

- Can compute transformation of every point on line or triangle by simply transforming the *control points*

© Wolfgang Heidrich

Homogeneous Coordinates

Homogeneous representation of points:

- Add an additional component $w=1$ to all *points*
- All multiples of this vector are considered to represent the same 3D point
- **Use square brackets (rather than round ones) to denote homogeneous coordinates (different from text book!)**

$$\begin{pmatrix} x \\ y \\ z \end{pmatrix} \equiv \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} \equiv \begin{bmatrix} x \cdot w \\ y \cdot w \\ z \cdot w \\ w \end{bmatrix} = \begin{bmatrix} x' \\ y' \\ z' \\ w \end{bmatrix}, \forall w \neq 0$$

Homogeneous Matrices

Affine Transformations

$$\begin{bmatrix} x' \\ y' \\ z' \\ 1 \end{bmatrix} = \begin{bmatrix} m_{1,1} & m_{1,2} & m_{1,3} & 0 \\ m_{2,1} & m_{2,2} & m_{2,3} & 0 \\ m_{3,1} & m_{3,2} & m_{3,3} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} + \begin{bmatrix} t_x \\ t_y \\ t_z \\ 0 \end{bmatrix}$$

$$= \begin{bmatrix} m_{1,1} & m_{1,2} & m_{1,3} & 0 \\ m_{2,1} & m_{2,2} & m_{2,3} & 0 \\ m_{3,1} & m_{3,2} & m_{3,3} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} + \begin{bmatrix} 0 & 0 & 0 & t_x \\ 0 & 0 & 0 & t_y \\ 0 & 0 & 0 & t_z \\ 0 & 0 & 0 & 0 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

© Wolfgang Heidrich

Homogeneous Matrices

Combining the two matrices into one:

$$\begin{bmatrix} x' \\ y' \\ z' \\ 1 \end{bmatrix} = \begin{bmatrix} m_{1,1} & m_{1,2} & m_{1,3} & 0 \\ m_{2,1} & m_{2,2} & m_{2,3} & 0 \\ m_{3,1} & m_{3,2} & m_{3,3} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} + \begin{bmatrix} 0 & 0 & 0 & t_x \\ 0 & 0 & 0 & t_y \\ 0 & 0 & 0 & t_z \\ 0 & 0 & 0 & 0 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

$$= \begin{bmatrix} m_{1,1} & m_{1,2} & m_{1,3} & t_x \\ m_{2,1} & m_{2,2} & m_{2,3} & t_y \\ m_{3,1} & m_{3,2} & m_{3,3} & t_z \\ 0 & 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

© Wolfgang Heidrich

Homogeneous Matrices

Note:

- Multiplication of the matrix with a constant does not change the transformation!

$$\tilde{T} \left(\begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} \right) = \begin{bmatrix} m_{1,1} \cdot k & m_{1,2} \cdot k & m_{1,3} \cdot k & t_x \cdot k \\ m_{2,1} \cdot k & m_{2,2} \cdot k & m_{2,3} \cdot k & t_y \cdot k \\ m_{3,1} \cdot k & m_{3,2} \cdot k & m_{3,3} \cdot k & t_z \cdot k \\ 0 & 0 & 0 & k \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x' \cdot k \\ y' \cdot k \\ z' \cdot k \\ k \end{bmatrix}$$

$$\equiv \begin{bmatrix} x' \\ y' \\ z' \\ 1 \end{bmatrix} = T \left(\begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} \right)$$

© Wolfgang Heidrich

Homogeneous Vectors

Earlier discussion describes points only

- What about vectors (directions)?
- What is the affine transformation of a vector?
 - *Rotation*
 - *Scaling*
 - *Translation*

Vectors are invariant under translation!

© Wolfgang Heidrich

Homogeneous Vectors

Representing vectors in homogeneous coordinates

- Need representation that is only affected by linear transformations, but not by translations
- This is achieved by setting $w=0$

$$T \begin{pmatrix} x \\ y \\ z \\ 0 \end{pmatrix} = \begin{bmatrix} m_{1,1} & m_{1,2} & m_{1,3} & t_x \\ m_{2,1} & m_{2,2} & m_{2,3} & t_y \\ m_{3,1} & m_{3,2} & m_{3,3} & t_z \\ 0 & 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ z \\ 0 \end{bmatrix} = \begin{bmatrix} x' \\ y' \\ z' \\ 0 \end{bmatrix}$$

© Wolfgang Heidrich

Homogeneous Coordinates

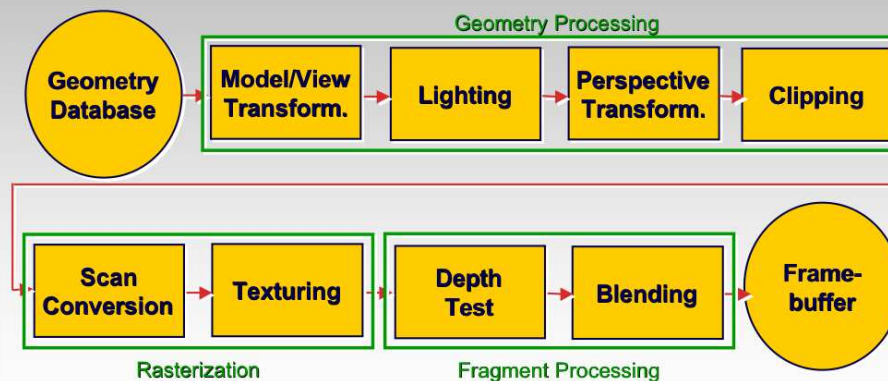

Properties

- Unified representation as 4-vector (in 3D) for
 - Points
 - Vectors / directions
- Affine transformations become 4x4 matrices
 - Composing multiple affine transformations involves simply multiplying the matrices
 - 3D affine transformations have 12 degrees of freedom
 - Need mapping of 4 points to uniquely define transformation

© Wolfgang Heidrich

The Rendering Pipeline

© Wolfgang Heidrich

Modeling Transformation

Purpose:

- Map geometry from local *object coordinate system* into a global *world coordinate system*
- Same as *placing objects*

Transformations:

- Arbitrary affine transformations are possible
 - Even more complex transformations may be desirable, but are not available in hardware
 - Freeform deformations

© Wolfgang Heidrich

Viewing Transformation

Purpose:

- Map geometry from *world coordinate system* into *camera coordinate system*
- Camera coordinate system is *right-handed*, viewing direction is *negative z-axis*
- Same as *placing camera*

Transformations:

- Usually only *rigid body transformations*
 - Rotations and translations
- Objects have same size and shape in camera and world coordinates

© Wolfgang Heidrich

Model/View Transformation

Combine modeling and viewing transform.

- Combine both into a single matrix
- Saves computation time if many points are to be transformed
- Possible because the viewing transformation directly follows the modeling transformation without intermediate operations

© Wolfgang Heidrich

Homogeneous Planes And Normals

Planes in Cartesian Coordinates:

$$\{(x, y, z)^T \mid n_x x + n_y y + n_z z + d = 0\}$$

- $n_x, n_y, n_z,$ and d are the parameters of the plane (normal and distance from origin)

Planes in Homogeneous Coordinates:

$$\{[x, y, z, w]^T \mid n_x x + n_y y + n_z z + dw = 0\}$$

© Wolfgang Heidrich

Homogeneous Planes And Normals

Planes in homogeneous coordinates are represented as row vectors

- $E = [n_x, n_y, n_z, d]$
- Condition that a point $[x, y, z, w]^T$ is located in E

$$\begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix} \in E = [n_x, n_y, n_z, d] \Leftrightarrow [n_x, n_y, n_z, d] \cdot \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix} = 0$$

© Wolfgang Heidrich

Homogeneous Planes And Normals

Transformations of planes

$$[n_x, n_y, n_z, d] \cdot \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix} = 0 \Leftrightarrow T([n_x, n_y, n_z, d]) \cdot (\mathbf{A} \cdot \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix}) = 0$$

© Wolfgang Heidrich

Homogeneous Planes And Normals

Transformations of planes

$$[n_x, n_y, n_z, d] \cdot \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix} = 0 \Leftrightarrow ([n_x, n_y, n_z, d] \cdot \mathbf{A}^{-1}) \cdot (\mathbf{A} \cdot \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix}) = 0$$

- Works for $T([n_x, n_y, n_z, d]) = [n_x, n_y, n_z, d] \mathbf{A}^{-1}$
- Thus: planes have to be transformed by the *inverse* of the affine transformation (multiplied from left as a row vector)!

© Wolfgang Heidrich

Homogeneous Planes And Normals

Homogeneous Normals

- The plane definition also contains its normal
- Normal written as a vector $[n_x, n_y, n_z, 0]^T$

$$\begin{pmatrix} n_x \\ n_y \\ n_z \\ 0 \end{pmatrix} \cdot \begin{bmatrix} v_x \\ v_y \\ v_z \\ 0 \end{bmatrix} = 0 \Leftrightarrow ((\mathbf{A}^{-T} \cdot \begin{bmatrix} n_x \\ n_y \\ n_z \\ 0 \end{bmatrix}) \cdot (\mathbf{A} \cdot \begin{bmatrix} v_x \\ v_y \\ v_z \\ 0 \end{bmatrix})) = 0$$

- Thus: the normal to any surface has to be transformed by the inverse transpose of the affine transformation (multiplied from the right as a column vector)!

© Wolfgang Heidrich

Transforming Homogeneous Normals

Inverse Transpose of

- Rotation by α
 - *Rotation by α*
- Scale by s
 - *Scale by $1/s$*
- Translation by t
 - *Identity matrix!*
- Shear by a along x axis
 - *Shear by $-a$ along y axis*

© Wolfgang Heidrich

Coming Up...

Tuesday, Sep 18:

- OpenGL transformations, matrix stacks

Thursday, Sep 20:

- Cameras & perspective transformations
