# Unit \#2: Complexity Theory and Asymptotic Analysis CPSC 221: Algorithms and Data Structures 

Lars Kotthoff ${ }^{1}$<br>larsko@cs.ubc.ca

${ }^{1}$ With material from Will Evans, Steve Wolfman, Alan Hu, Ed Knorr, and Kim Voll.

## Unit Outline

$\triangleright$ Brief proof reminder
$\triangleright$ Algorithm Analysis: Counting steps
$\triangleright$ Asymptotic Notation
$\triangleright$ Runtime Examples
$\triangleright$ Problem Complexity

## Learning Goals

$\triangleright$ Given code, write a formula that measures the number of steps executed as a function of the size of the input.
$\triangleright$ Use asymptotic notation to simplify functions and to express relations between functions.
$\triangleright$ Know the asymptotic relations between common functions.
$\triangleright$ Understand why to use worst-case, best-case, or average-case complexity measures.
$\triangleright$ Give examples of tractable, intractable, and undecidable problems.

## Proof by ...

$\triangleright$ Counterexample
$\triangleright$ show an example which does not fit with the theorem
$\triangleright$ Thus, the theorem is false.
$\triangleright$ Contradiction
$\square$ assume the opposite of the theorem
$\triangleright$ derive a contradiction
$\triangleright$ Thus, the theorem is true.
$\triangleright$ Induction
$\triangleright$ prove for a base case (e.g., $n=1$ )
$\triangleright$ assume for all $n \leq k$ (for arbitrary $k$ )
$\triangleright$ prove for the next value $(n=k+1)$
$\triangleright$ Thus, the theorem is true.

## Example: Proof by Induction (worked) $1 / 4$

Theorem:
A positive integer $x$ is divisible by 3 if and only if the sum of its decimal digits is divisible by 3 .

Proof:
Let $x_{1} x_{2} x_{3} \ldots x_{n}$ be the decimal digits of $x$.
Let the sum of its decimal digits be

$$
S(x)=\sum_{i=1}^{n} x_{i}
$$

We'll prove the stronger result:

$$
S(x) \bmod 3=x \bmod 3
$$

How do we use induction?

## Example: Proof by Induction (worked) 2/4

Base Case:
Consider any number $x$ with one ( $n=1$ ) digit (0-9).

$$
S(x)=\sum_{i=1}^{n} x_{i}=x_{1}=x
$$

So, it's trivially true that $S(x) \bmod 3=x \bmod 3$ when $n=1$.

## Example: Proof by Induction (worked) 3/4

Inductive hypothesis:
Assume for an arbitrary integer $k>0$ that for any number $x$ with $n \leq k$ digits:

$$
S(x) \bmod 3=x \bmod 3
$$

Inductive step:
Consider a number $x$ with $n=k+1$ digits:

$$
x=x_{1} x_{2} \ldots x_{k} x_{k+1}
$$

Let $z$ be the number $x_{1} x_{2} \ldots x_{k}$. It's a $k$-digit number so the inductive hypothesis applies:

$$
S(z) \bmod 3=z \bmod 3
$$

## Example: Proof by Induction (worked) 4/4

Inductive step (continued):

$$
\begin{aligned}
x \bmod 3 & =\left(10 z+x_{k+1}\right) \bmod 3 & & \left(x=10 z+x_{k+1}\right) \\
& =\left(9 z+z+x_{k+1}\right) \bmod 3 & & \\
& =\left(z+x_{k+1}\right) \bmod 3 & & (9 z \text { is divisible by } 3) \\
& =\left(S(z)+x_{k+1}\right) \bmod 3 & & \text { (induction hypothesis) } \\
& =\left(x_{1}+x_{2}+\cdots+x_{k}+x_{k+1}\right) \bmod 3 & & \\
& =S(x) \bmod 3 & &
\end{aligned}
$$

QED (quod erat demonstrandum: "what was to be demonstrated")

## A Task to Solve and Analyze

Find a student's name in a class given her student ID

## Analysis of Algorithms

$\triangleright$ Analysis of an algorithm gives insight into
$\triangleright$ how long the program runs (time complexity or runtime) and
$\triangleright$ how much memory it uses (space complexity).
$\triangleright$ Analysis can provide insight into alternative algorithms
$\triangleright$ Input size is indicated by a non-negative integer $n$ (sometimes there are multiple measures of an input's size)
$\triangleright$ Running time is a real-valued function of $n$ such as:

$$
\begin{aligned}
& \triangleright T(n)=4 n+5 \\
& \triangleright T(n)=0.5 n \log n-2 n+7 \\
& \triangleright T(n)=2^{n}+n^{3}+3 n
\end{aligned}
$$

## Rates of Growth

Suppose a computer executes 1op per picosecond (trillionth):

| $n=$ | 10 |
| :--- | ---: |
| $\log n$ | 1 ps |
| $n$ | 10 ps |
| $n \log n$ | 10 ps |
| $n^{2}$ | 100 ps |
| $2^{n}$ | 1 ns |

## Rates of Growth

Suppose a computer executes 1op per picosecond (trillionth):

| $n=$ | 10 | 100 |
| :--- | ---: | ---: |
| $\log n$ | 1 ps | 2 ps |
| $n$ | 10 ps | 100 ps |
| $n \log n$ | 10 ps | 200 ps |
| $n^{2}$ | 100 ps | 10 ns |
| $2^{n}$ | 1 ns | 1 Es |

Exasecond(Es) $=32$ billion years

## Rates of Growth

Suppose a computer executes 1op per picosecond (trillionth):

| $n=$ | 10 | 100 | 1,000 |
| :--- | ---: | ---: | ---: |
| $\log n$ | 1 ps | 2 ps | 3 ps |
| $n$ | 10 ps | 100 ps | 1 ns |
| $n \log n$ | 10 ps | 200 ps | 3 ns |
| $n^{2}$ | 100 ps | 10 ns | $1 \mu \mathrm{~s}$ |
| $2^{n}$ | 1 ns | 1 Es | $10^{289} \mathrm{~s}$ |

Exasecond(Es) $=32$ billion years

## Rates of Growth

Suppose a computer executes 1op per picosecond (trillionth):

| $n=$ | 10 | 100 | 1,000 | 10,000 |
| :--- | ---: | ---: | ---: | ---: |
| $\log n$ | 1 ps | 2 ps | 3 ps | 4 ps |
| $n$ | 10 ps | 100 ps | 1 ns | 10 ns |
| $n \log n$ | 10 ps | 200 ps | 3 ns | 40 ns |
| $n^{2}$ | 100 ps | 10 ns | $1 \mu \mathrm{~s}$ | $100 \mu \mathrm{~s}$ |
| $2^{n}$ | 1 ns | 1 Es | $10^{289} \mathrm{~s}$ |  |

Exasecond(Es) $=32$ billion years

## Rates of Growth

Suppose a computer executes 1op per picosecond (trillionth):

| $n=$ | 10 | 100 | 1,000 | 10,000 | $10^{5}$ |
| :--- | ---: | ---: | ---: | ---: | ---: |
| $\log n$ | 1 ps | 2 ps | 3 ps | 4 ps | 5 ps |
| $n$ | 10 ps | 100 ps | 1 ns | 10 ns | 100 ns |
| $n \log n$ | 10 ps | 200 ps | 3 ns | 40 ns | 500 ns |
| $n^{2}$ | 100 ps | 10 ns | $1 \mu \mathrm{~s}$ | $100 \mu \mathrm{~s}$ | 10 ms |
| $2^{n}$ | 1 ns | 1 Es | $10^{289} \mathrm{~s}$ |  |  |

Exasecond(Es) $=32$ billion years

## Rates of Growth

Suppose a computer executes 1op per picosecond (trillionth):

| $n=$ | 10 | 100 | 1,000 | 10,000 | $10^{5}$ | $10^{6}$ |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| $\log n$ | 1 ps | 2 ps | 3 ps | 4 ps | 5 ps | 6 ps |
| $n$ | 10 ps | 100 ps | 1 ns | 10 ns | 100 ns | $1 \mu \mathrm{~s}$ |
| $n \log n$ | 10 ps | 200 ps | 3 ns | 40 ns | 500 ns | $6 \mu \mathrm{~s}$ |
| $n^{2}$ | 100 ps | 10 ns | $1 \mu \mathrm{~s}$ | $100 \mu \mathrm{~s}$ | 10 ms | 1 s |
| $2^{n}$ | 1 ns | 1 Es | $10^{289} \mathrm{~s}$ |  |  |  |

Exasecond(Es) $=32$ billion years

## Rates of Growth

Suppose a computer executes 1op per picosecond (trillionth):

| $n=$ | 10 | 100 | 1,000 | 10,000 | $10^{5}$ | $10^{6}$ | $10^{9}$ |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $\log n$ | 1 ps | 2 ps | 3 ps | 4 ps | 5 ps | 6 ps | 9 ps |

| $2^{n}$ | 1 ns | 1 Es | $10^{289} \mathrm{~s}$ |  |  |  |  |

Exasecond(Es) $=32$ billion years

## Analyzing Code

// Linear search
find (key, array)
for $i=0$ to length(array) - 1 do
if array[i] == key
return i
return -1

1) What's the input size, $n$ ?

## Analyzing Code

```
// Linear search
find(key, array)
    for i = 0 to length(array) - 1 do
        if array[i] == key
            return i
    return -1
```

2) Should we assume a worst-case, best-case, or average-case input of size $n$ ?

## Analyzing Code

// Linear search
find (key, array)
for i = 0 to length(array) - 1 do
if array[i] == key
return i
return -1
3) How many lines are executed as a function of $n$ ?
$T(n)=$
Are lines the right unit?

## Analyzing Code

The number of lines executed in the worst-case is:

$$
T(n)=2 n+1
$$

$\triangleright$ Does the "2" matter?
$\triangleright$ Does the " 1 " matter?
