## Rasterization

<http://www.ugrad.cs.ubc.ca/~cs314/Vjan2013>

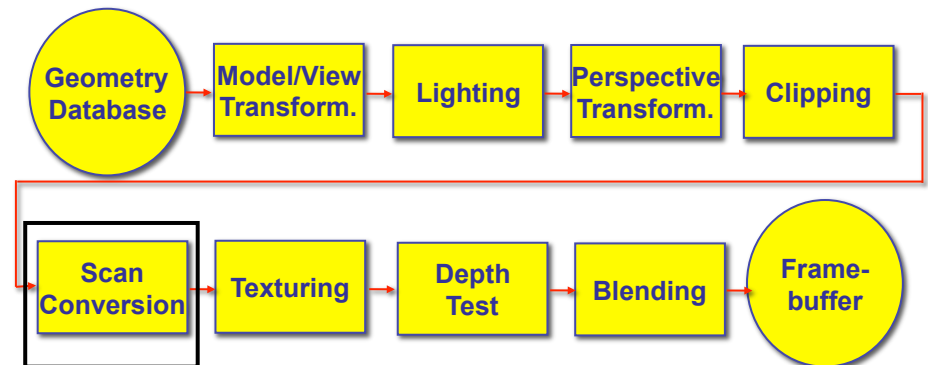

## Reading for This Module

- FCG Chap 3 Raster Algorithms (through 3.2)
- Section 2.7 Triangles
- Section 8.1 Rasterization (through 8.1.2)

2

## Rasterization

## Rendering Pipeline

3

4

## Scan Conversion - Rasterization

- convert continuous rendering primitives into discrete fragments/pixels
  - lines
    - midpoint/Bresenham
  - triangles
    - flood fill
    - scanline
    - implicit formulation
  - interpolation

5

## Scan Conversion

- given vertices in DCS, fill in the pixels
- display coordinates required to provide scale for discretization
  - [demo]

6

## Basic Line Drawing

$$y = mx + b$$

$$y = \frac{(y_1 - y_0)}{(x_1 - x_0)}(x - x_0) + y_0$$

- goals
  - integer coordinates
  - thinnest line with no gaps
- assume
  - $x_0 < x_1$ , slope  $0 < dy/dx < 1$ 
    - one octant, other cases symmetric
- how can we do this more quickly?

```

Line (  $x_0, y_0, x_1, y_1$  )
begin
float  $dx, dy, x, y, slope$  ;
 $dx \leftarrow x_1 - x_0$ ;
 $dy \leftarrow y_1 - y_0$ ;
 $slope \leftarrow dy/dx$ ;
 $y \leftarrow y_0$ 
for  $x$  from  $x_0$  to  $x_1$  do
    begin
        PlotPixel (  $x, \text{Round}(y)$  ) ;
         $y \leftarrow y + slope$  ;
    end ;
end ;
    
```

## Midpoint Algorithm

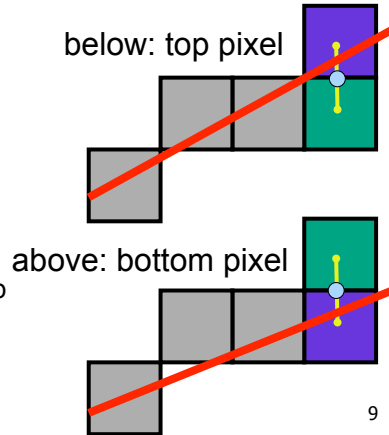

- we're moving horizontally along x direction (first octant)
  - only two choices: draw at current y value, or move up vertically to y + 1?
    - check if midpoint between two possible pixel centers above or below line
  - candidates
    - top pixel: (x+1, y+1)
    - bottom pixel: (x+1, y)
  - midpoint: (x+1, y+.5)
- check if midpoint above or below line
  - below: pick top pixel
  - above: pick bottom pixel
- other octants: different tests
  - octant II: y loop, check x left/right

8

## Midpoint Algorithm

- we're moving horizontally along x direction (first octant)
  - only two choices: draw at current y value, or move up vertically to y+1?
    - check if midpoint between two possible pixel centers above or below line
  - candidates
    - top pixel: (x+1,y+1)
    - bottom pixel: (x+1, y)
  - midpoint: (x+1, y+.5)
- check if midpoint above or below line
  - below: pick top pixel
  - above: pick bottom pixel
- key idea behind Bresenham
  - reuse computation from previous step
  - integer arithmetic by doubling values
  - [demo]

9

## Bresenham, Detailed Derivation

- Goal: function F tells us if line is above or below some point
  - $F(x,y) = 0$  on line
  - $F(x,y) < 0$  when line under point
  - $F(x,y) > 0$  when line over point

$$y = mx + b$$

$$y = \frac{dy}{dx}x + b$$

$$dx * y = dy * x + b * dx$$

$$0 = dy * x - dx * y + b * dx$$

$$2 * 0 = 2 * dy * x - 2 * dx * y + 2 * b * dx$$

$$0 = 2 * dy * x - 2 * dx * y + 2 * b * dx$$

$$F(x,y) = 2 * dy * x - 2 * dx * y + 2 * b * dx$$

10

## Using F with Midpoints: Initial

$$F(x_0, y_0) = 2 * dy * x_0 - 2 * dx * y_0 + 2 * b * dx$$

$$F(x_0 + 1, y_0 + .5)$$

$$= 2 * dy * (x_0 + 1) - 2 * dx * (y_0 + .5) + 2 * b * dx$$

$$= 2 * dy * x_0 + 2 * dy - 2 * dx * y_0 - dx + 2 * b * dx$$

11

## Incremental F: Initial

$$F(x_0, y_0) = 2 * dy * x_0 - 2 * dx * y_0 + 2 * b * dx$$

$$F(x_0 + 1, y_0 + .5)$$

$$= 2 * dy * (x_0 + 1) - 2 * dx * (y_0 + .5) + 2 * b * dx$$

$$= 2 * dy * x_0 + 2 * dy - 2 * dx * y_0 - dx + 2 * b * dx$$

$$F(x_0 + 1, y_0 + .5) - F(x_0, y_0) = 2 * dy - dx = \mathbf{diff}$$

- Initial difference in F:  $2 * dy - dx$

12

## Using F with Midpoints: No Y Change

$$F(x_0 + 1, y_0 + .5)$$

$$= 2 * dy * x_0 + 2 * dy - 2 * dx * y_0 - dx + 2 * b * dx$$

$$F(x_0 + 2, y_0 + .5)$$

$$= 2 * dy * (x_0 + 2) - 2 * dx * (y_0 + .5) + 2 * b * dx$$

$$= 2 * dy * x_0 + 4 * dy - 2 * dx * y_0 - dx + 2 * b * dx$$

13

## Incremental F: No Y Change

$$F(x_0 + 1, y_0 + .5)$$

$$= 2 * dy * x_0 + 2 * dy - 2 * dx * y_0 - dx + 2 * b * dx$$

$$F(x_0 + 2, y_0 + .5)$$

$$= 2 * dy * (x_0 + 2) - 2 * dx * (y_0 + .5) + 2 * b * dx$$

$$= 2 * dy * x_0 + 4 * dy - 2 * dx * y_0 - dx + 2 * b * dx$$

$$F(x_0 + 2, y_0 + .5) - F(x_0 + 1, y_0 + .5) = 2 * dy = \mathbf{diff}$$

- Next difference in F:  $2 * dy$  (no change in y for pixel)<sup>14</sup>

## Using F with Midpoints: Y Increased

$$F(x_0 + 2, y_0 + .5)$$

$$= 2 * dy * x_0 + 4 * dy - 2 * dx * y_0 - dx + 2 * b * dx$$

$$F(x_0 + 3, y_0 + 1.5)$$

$$= 2 * dy * (x_0 + 3) - 2 * dx * (y_0 + 1.5) + 2 * b * dx$$

$$= 2 * dy * x_0 + 6 * dy - 2 * dx * y_0 - 3 * dx + 2 * b * dx$$

15

## Incremental F: Y Increased

$$F(x_0 + 2, y_0 + .5)$$

$$= 2 * dy * x_0 + 4 * dy - 2 * dx * y_0 - dx + 2 * b * dx$$

$$F(x_0 + 3, y_0 + 1.5)$$

$$= 2 * dy * (x_0 + 3) - 2 * dx * (y_0 + 1.5) + 2 * b * dx$$

$$= 2 * dy * x_0 + 6 * dy - 2 * dx * y_0 - 3 * dx + 2 * b * dx$$

$$F(x_0 + 3, y_0 + 1.5) - F(x_0 + 2, y_0 + .5) = 2 * dy - 2 * dx = \mathbf{diff}$$

- Next difference in F:  $2 * dy - 2 * dx$  (when pixel at  $y+1$ )<sup>16</sup>

## Bresenham: Reuse Computation, Integer Only

```
y=y0;
dx = x1-x0;
dy = y1-y0;
d = 2*dy-dx;
incKeepY = 2*dy;
incIncreaseY = 2*dy-2*dx;
for (x=x0; x <= x1; x++) {
  draw(x, y);
  if (d>0) then {
    y = y + 1;
    d += incIncreaseY;
  } else {
    d += incKeepY;
  }
}
```

17

## Rasterizing Polygons/Triangles

- basic surface representation in rendering
- why?
  - lowest common denominator
    - can approximate any surface with arbitrary accuracy
      - all polygons can be broken up into triangles
  - guaranteed to be:
    - planar
    - triangles - convex
  - simple to render
    - can implement in hardware

18

## Triangulating Polygons

- simple convex polygons
  - trivial to break into triangles
  - pick one vertex, draw lines to all others not immediately adjacent
  - OpenGL supports automatically
    - glBegin(GL\_POLYGON) ... glEnd()
- concave or non-simple polygons
  - more effort to break into triangles
  - simple approach may not work
  - OpenGL can support at extra cost
    - gluNewTess(), gluTessCallback(), ...

19

## Problem

- input: closed 2D polygon
- problem: fill its interior with specified color on graphics display
- assumptions
  - simple - no self intersections
  - simply connected
- solutions
  - flood fill
  - edge walking

## Flood Fill

- simple algorithm
  - draw edges of polygon
  - use flood-fill to draw interior

21

## Flood Fill

- start with **seed point**
- recursively set all neighbors until boundary is hit

22

## Flood Fill

- draw edges
- run:

```
FloodFill(Polygon P, int x, int y, Color C)
if not (OnBoundary(x,y,P) or Colored(x,y,C))
begin
    PlotPixel(x,y,C);
    FloodFill(P,x+1,y,C);
    FloodFill(P,x,y+1,C);
    FloodFill(P,x,y-1,C);
    FloodFill(P,x-1,y,C);
end ;
```
- drawbacks?

23

## Flood Fill Drawbacks

- pixels visited up to 4 times to check if already set
- need per-pixel flag indicating if set already
  - must clear for every polygon!

24

## Scanline Algorithms

- **scanline**: a line of pixels in an image
  - set pixels inside polygon boundary along horizontal lines one pixel apart vertically

25

## General Polygon Rasterization

- how do we know whether given pixel on scanline is inside or outside polygon?

26

## General Polygon Rasterization

- idea: use a **parity test**

```

for each scanline
  edgeCnt = 0;
  for each pixel on scanline (l to r)
    if (oldpixel->newpixel crosses edge)
      edgeCnt ++;
    // draw the pixel if edgeCnt odd
    if (edgeCnt % 2)
      setPixel(pixel);
    
```

27

## Making It Fast: Bounding Box

- smaller set of candidate pixels
  - loop over xmin, xmax and ymin,ymax instead of all x, all y

28

## Triangle Rasterization Issues

- moving slivers

- shared edge ordering

29

## Triangle Rasterization Issues

- *exactly which pixels should be lit?*
  - pixels with centers inside triangle edges
- *what about pixels exactly on edge?*
  - draw them: order of triangles matters (it shouldn't)
  - don't draw them: gaps possible between triangles
- need a consistent (if arbitrary) rule
  - example: draw pixels on left or top edge, but not on right or bottom edge
  - example: check if triangle on same side of edge as offscreen point

30

## Interpolation

31

## Interpolation During Scan Conversion

- drawing pixels in polygon requires interpolating many values between vertices
  - r,g,b colour components
    - use for shading
  - z values
  - u,v texture coordinates
  - $N_x, N_y, N_z$  surface normals
- equivalent methods (for triangles)
  - bilinear interpolation
  - barycentric coordinates

32

## Bilinear Interpolation

- interpolate quantity along  $L$  and  $R$  edges, as a function of  $y$ 
  - then interpolate quantity as a function of  $x$

33

## Barycentric Coordinates

- non-orthogonal coordinate system based on triangle itself
  - origin:  $P_1$ , basis vectors:  $(P_2 - P_1)$  and  $(P_3 - P_1)$

$$P = P_1 + \beta(P_2 - P_1) + \gamma(P_3 - P_1)$$

34

## Barycentric Coordinates

35

## Barycentric Coordinates

- non-orthogonal coordinate system based on triangle itself
  - origin:  $P_1$ , basis vectors:  $(P_2 - P_1)$  and  $(P_3 - P_1)$

$$P = P_1 + \beta(P_2 - P_1) + \gamma(P_3 - P_1)$$

$$P = (1 - \beta - \gamma)P_1 + \beta P_2 + \gamma P_3$$

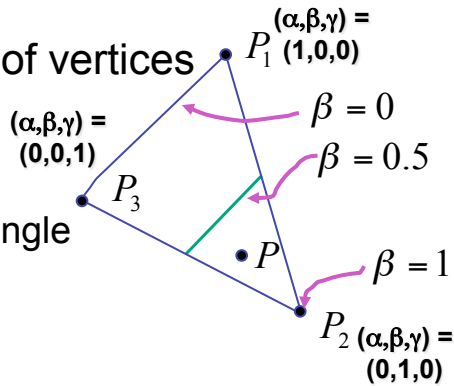

$$P = \alpha P_1 + \beta P_2 + \gamma P_3$$

36

## Using Barycentric Coordinates

- weighted combination of vertices
- smooth mixing
- speedup
  - compute once per triangle

$$\begin{cases} P = \alpha \cdot P_1 + \beta \cdot P_2 + \gamma \cdot P_3 \\ \alpha + \beta + \gamma = 1 \\ 0 \leq \alpha, \beta, \gamma \leq 1 \text{ for points inside triangle} \end{cases}$$

“convex combination of points”

37

## Deriving Barycentric From Bilinear

- from bilinear interpolation of point P on scanline

$$\begin{aligned} P_L &= P_2 + \frac{d_1}{d_1 + d_2} (P_3 - P_2) \\ &= \left(1 - \frac{d_1}{d_1 + d_2}\right) P_2 + \frac{d_1}{d_1 + d_2} P_3 = \\ &= \frac{d_2}{d_1 + d_2} P_2 + \frac{d_1}{d_1 + d_2} P_3 \end{aligned}$$

38

## Deriving Barycentric From Bilinear

- similarly

$$\begin{aligned} P_R &= P_2 + \frac{b_1}{b_1 + b_2} (P_1 - P_2) \\ &= \left(1 - \frac{b_1}{b_1 + b_2}\right) P_2 + \frac{b_1}{b_1 + b_2} P_1 = \\ &= \frac{b_2}{b_1 + b_2} P_2 + \frac{b_1}{b_1 + b_2} P_1 \end{aligned}$$

39

## Deriving Barycentric From Bilinear

- combining

$$\begin{aligned} P &= \frac{c_2}{c_1 + c_2} \cdot P_L + \frac{c_1}{c_1 + c_2} \cdot P_R \\ P_L &= \frac{d_2}{d_1 + d_2} P_2 + \frac{d_1}{d_1 + d_2} P_3 \\ P_R &= \frac{b_2}{b_1 + b_2} P_2 + \frac{b_1}{b_1 + b_2} P_1 \end{aligned}$$

- gives

$$P = \frac{c_2}{c_1 + c_2} \left( \frac{d_2}{d_1 + d_2} P_2 + \frac{d_1}{d_1 + d_2} P_3 \right) + \frac{c_1}{c_1 + c_2} \left( \frac{b_2}{b_1 + b_2} P_2 + \frac{b_1}{b_1 + b_2} P_1 \right)$$

40

## Deriving Barycentric From Bilinear

- thus  $P = \alpha P_1 + \beta P_2 + \gamma P_3$  with

$$\alpha = \frac{c_1}{c_1 + c_2} \frac{b_1}{b_1 + b_2}$$

$$\beta = \frac{c_2}{c_1 + c_2} \frac{d_2}{d_1 + d_2} + \frac{c_1}{c_1 + c_2} \frac{b_2}{b_1 + b_2}$$

$$\gamma = \frac{c_2}{c_1 + c_2} \frac{d_1}{d_1 + d_2}$$

- can verify barycentric properties

$$\alpha + \beta + \gamma = 1, \quad 0 \leq \alpha, \beta, \gamma \leq 1$$

## Computing Barycentric Coordinates

- 2D triangle area
  - half of parallelogram area
    - from cross product

$$A = A_{P_1} + A_{P_2} + A_{P_3}$$

$$\alpha = A_{P_1} / A$$
$$\beta = A_{P_2} / A$$
$$\gamma = A_{P_3} / A$$
