1. Transformations as a change of coordinate frame

(a) (3 points) Express the coordinates of point P with respect to coordinate frames A, B, and C.

(b) (3 points) Express the coordinates of vector V with respect to coordinate frames A, B, and C.

(c) (3 points) Fill in the 2D transformation matrix that takes points from $F_B$ to $F_A$, as given to the right of the above figure.

(d) (3 points) Fill in the 2D transformation matrix that takes points from $F_A$ to $F_C$, as given to the right of the above figure. Hint: You might first want to determine what combination of $i_C$ and $j_C$ are needed to reproduce $5i_A$ and $5j_A$.

(e) (3 points) Using your answers for the above two matrices, develop a 2D transformation matrix that takes points from $F_B$ to $F_C$. Test your solution using point P.
2. Interpreting a Matrix Transformation

(a) (2 points) On the above diagram, sketch the origin and basis vectors of the coordinate frame \( F_{\text{obj}} \) that results from the given transformation matrix.

(b) (2 points) The drawing of the above house represents its untransformed shape. Sketch the transformed version of the house in the above diagram.

(c) (2 points) Given \( M = \text{Translate}(a, b, 0) \text{Rotate}(z, \theta) \text{Scale}(c, c, c) \), provide the values of \( a, b, c \) and \( \theta \) that would implement the given transformation.

(d) (2 points) Given \( M = \text{Rotate}(z, \theta) \text{Translate}(a, b, 0) \text{Scale}(c, c, c) \), provide the values of \( a, b, c \) and \( \theta \) that would implement the given transformation.
3. Composing Transformations

(a) (3 points) Consider a house in the $xy$-plane, defined by the coordinates $(0,0)$, $(2,0)$, $(2,2)$, $(1,3)$, $(0,2)$. Assume $z = 0$ for all vertices. Sketch the house resulting from the following transformations. Assume that the matrix $M$ is initialised to the identity matrix.

```
M.identity();
M.translate(5,-1,0);
M.rotate(90, 0,0,1);
M.scale(2,1,1);
M.translate(1,0,0);
drawHouse();
```

(b) (3 points) Give the resulting $4 \times 4$ transformation matrix, $M$.

(c) (3 points) What values would need to be assigned to theta, a, b, c, d, e, f in order for the following transformations to yield an identical final transformation?

```
M.identity();
M.rotate(theta, 0,0,1);
M.translate(a,b,c);
M.scale(d,e,f);
drawHouse();
```
4. Scene Graphs

(a) (3 points) Sketch a scene graph for the scene below. Use directed edges, i.e., arrows, to represent transformations that connect the nodes in the graph. Label each edge with a unique name, $M_n$, which indicates the transformation matrix that takes points from the frame $F_n$ (for link $L_n$) to its parent frame. Use the world coordinate frame as the root note of the scene graph. Assume that the body (L7) and the camera are positioned relative to the world frame. Assume that all other parts are defined relative to their proximal parent links, i.e., the links closer to the body.

(b) (2 points) Give an expression for the composite transformation that would be used when drawing point $P_6$, as defined in frame $F_6$ for link L6. i.e., it should transform point $P_6$ to the camera coordinate frame. Your answer should be expressed as a product of the matrices used to label your scene graph.

(c) (2 points) Give an expression for the composite transformation that transforms point, $P_6$, as defined in frame $F_6$, to the head coordinate frame, $F_1$. Your answer should be expressed as a product of the matrices used to label your scene graph.
(d) (2 points) Give an expression for the opposite transformation, i.e., one that transforms a point, $P_1$, in the head coordinate frame, $F_1$, to the coordinate frame $F_6$.

(e) (2 points) Give the value of the matrix $M_4$ that is implemented by the code below, i.e., the relative transformation of L4 with respect to L3.

```cpp
// implement M4: transformation of L4 relative to L3
M.translate(4,0,0); // translate in x
M.rotate(90,0,0,1); // rotate by 90 degrees around z
DrawL4();
```

Give all the elements of the implemented matrix $M_4$.

5. (4 points) Viewing Transformation

Determine the viewing transformation, $M_{view}$, that takes points from WCS (world coordinates) to VCS (viewing or camera coordinates), for the following camera parameters: $P_{eye} = (-50, 20, 20)$, $P_{ref} = (0, 20, 20)$, $V_{up} = (1, 0, 1)$. There is no need to numerically invert any matrices, i.e., it is ok to specify $M_{view} = M_{cam}^{-1}$.
