

Chapter 4

Scan Conversion – Drawing Lines on Raster Display

Scan Conversion - Rasterization

- Convert continuous rendering primitives into discrete fragments/pixels
 - Lines
 - Bresenham
 - Triangles
 - Flood Fill
 - Scanline
 - Implicit formulation

Lines and Curves

- Explicit - one coordinate as function of the others

$$y = f(x)$$

$$z = f(x, y)$$

line

$$y = mx + b$$

$$y = \frac{(y_2 - y_1)}{(x_2 - x_1)}(x - x_1) + y_1$$

circle

$$y = \pm\sqrt{r^2 - x^2}$$

University of
British Columbia

Lines and Curves

- Parametric – all coordinates as functions of common parameter

$$(x, y) = (f_1(t), f_2(t))$$

$$(x, y, z) = (f_1(t), f_2(t), f_3(t))$$

line

$$x(t) = x_0 + t(x_1 - x_0)$$

$$y(t) = y_0 + t(y_1 - y_0)$$

$$t \in [0, 1]$$

circle

$$x(\theta) = r \cos(\theta)$$

$$y(\theta) = r \sin(\theta)$$

$$\theta \in [0, 2\pi]$$

University of
British Columbia

Lines and Curves

- Implicit - define as "zero set" of function of all the parameters
 - $\{(x, y) : F(x, y) = 0\}$
 - $\{(x, y, z) : F(x, y, z) = 0\}$
- Defines partition of space
 - $\{(x, y) : F(x, y) > 0\}, \{(x, y) : F(x, y) = 0\}, \{(x, y) : F(x, y) < 0\}$

	line		circle	
	$F(x, y) = (x - x_0) dy - (y - y_0) dx$		$F(x, y) = x^2 + y^2 - r^2$	
	$F(x, y) = 0$	(x,y) is on line	$F(x, y) = 0$	(x,y) is on circle
	$F(x, y) > 0$	(x,y) is below line	$F(x, y) > 0$	(x,y) is outside
	$F(x, y) < 0$	(x,y) is above line	$F(x, y) < 0$	(x,y) is inside

University of British Columbia

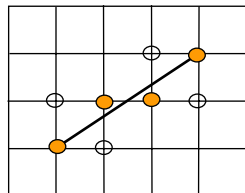

Basic Line Drawing

Assume $x_1 < x_2$ & line slope absolute value is ≤ 1

```

Line (x1, y1, x2, y2)
begin
float dx, dy, x, y, slope;
dx ← x2 - x1;
dy ← y2 - y1;
slope ← dy/dx;
y ← y1
for x from x1 to x2 do
begin
PlotPixel ( x, Round (y) );
y ← y + slope;
end;
end;
                
```

Questions:

- Can this algorithm use integer arithmetic ?
- Does it accumulate error ?
- Is the error significant ?

University of British Columbia

Recursive Line Drawing

Simple, recursive, integer, line drawing:

```

Line ( x1, y1, x2, y2 )
begin
  int x, y ;
  x ← ( x1 + x2 ) / 2 ;
  y ← ( y1 + y2 ) / 2 ;
  if ( ( x = x1 and y = y1 ) or
      ( x = x2 and y = y2 ) )
    return ;
  else begin
    PlotPixel ( x, y ) ;
    Line ( x1, y1, x, y ) ;
    Line ( x, y, x2, y2 ) ;
  end ;
end ;

```

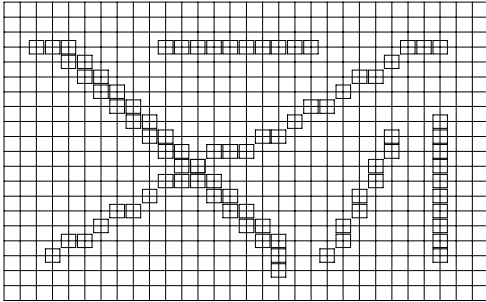

**University of
British Columbia**

Questions:
Does the algorithm accumulate error ?
Is it significant ?

Recursive Line Drawing (cont'd)

- **More Problems:**
 - Line not drawn sequentially
 - Function call for each pixel drawn

We want a faster algorithm !

**University of
British Columbia**

Midpoint (Bresenham) Algorithm

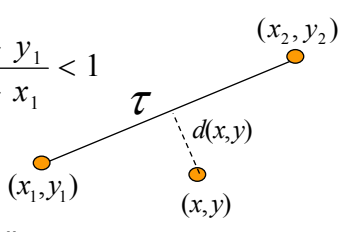

- **Assumptions:**

$$x_2 > x_1, y_2 > y_1 \text{ and } \frac{dy}{dx} = \frac{y_2 - y_1}{x_2 - x_1} < 1$$
- **Idea:**
 - Define error function
 - Proceed along the line incrementally
 - Select direction that minimizes accumulated error

Definitions

$$\tau = \{(x, y) \mid ax + by + c = xdy - ydx + c = 0\}$$

$$d(x, y) = 2(xdy - ydx + c)$$

University of
British Columbia

Bresenham Algorithm

$$d(x, y) = 2(xdy - ydx + c)$$

- Given point $P = (x, y)$, $d(x, y)$ is signed distance of P to τ (up to normalization factor)
- d is zero for $P \in \tau$
 $\Rightarrow d$ may serve as error function to be minimized
- Starting point satisfies $d(x_1, y_1) = 0$
- Each step moves right (east) or upper right (northeast)

University of
British Columbia

Midpoint Line Drawing (cont'd)

- Sign of $d(x_1 + 1, y_1 + \frac{1}{2})$ indicates if to move east or northeast
- At (x_1, y_1)

$$d_{start} = d(x_1 + 1, y_1 + \frac{1}{2}) = 2dy - dx$$
- Increment in d (after each step)
 - Move east $\Delta_e = d(x + 2, y + \frac{1}{2}) - d(x + 1, y + \frac{1}{2}) =$

$$2((x + 2)dy - (y + \frac{1}{2})dx + c) - 2((x + 1)dy - (y + \frac{1}{2})dx + c) = 2dy$$
 - Move northeast

$$\Delta_{ne} = d(x_1 + 2, y_1 + \frac{3}{2}) - d(x_1 + 1, y_1 + \frac{1}{2}) =$$

$$2((x + 2)dy - (y + \frac{3}{2})dx + c) - 2((x + 1)dy - (y + \frac{1}{2})dx + c) = 2(dy - dx)$$

University of British Columbia

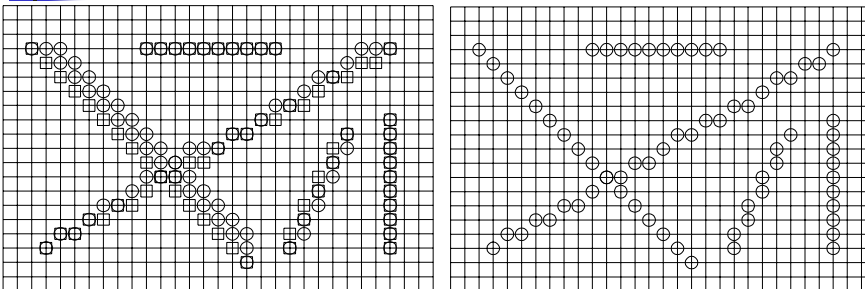

Midpoint Line Algorithm

```

Line ( x1, y1, x2, y2 )
begin
int  x, y, dx, dy, d, Δe, Δne ;
x ← x1 ;          y ← y1 ;
dx ← x2 - x1 ;   dy ← y2 - y1 ;
d ← 2 * dy - dx ;
Δe ← 2 * dy ;   Δne ← 2 * (dy - dx) ;
PlotPixel ( x, y ) ;
while ( x < x2 ) do
if ( d < 0 ) then
begin
d ← d + Δe ;
x ← x + 1 ;
end ;
else begin
d ← d + Δne ;
x ← x + 1 ;
y ← y + 1 ;
end ;
PlotPixel ( x, y ) ;
end ;
end ;
    
```

University of British Columbia

Midpoint Examples

Midpoint (circles) vs. Recursive (squares) line drawing

- Question: Is there a problem with this algorithm (horizontal vs. diagonal lines)?
- Comment: extends to higher order curves – e.g. circles

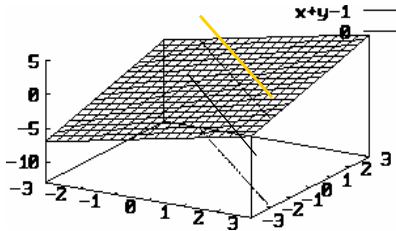

University of British Columbia

Error Function Intuition

- Error function d can be viewed as explicit surface:

$$d(x,y) = 2(xdy - ydx + c)$$

University of British Columbia
