## Viewing/Projections

Week 5, Wed Oct 6

## News

- assignment 1 posted

2

## Viewing (Review?)

3

## Using Transformations

- three ways
  - modelling transforms
    - place objects within scene (shared world)
    - affine transformations
  - viewing transforms
    - place camera
    - rigid body transformations: rotate, translate
  - projection transforms
    - change type of camera
    - projective transformation

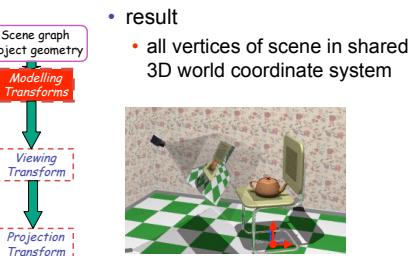

4

## Rendering Pipeline

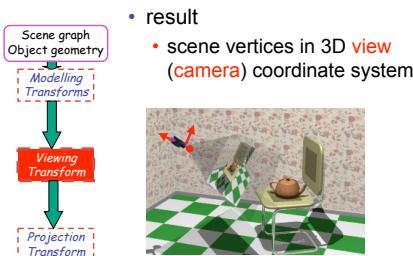

5

## Rendering Pipeline

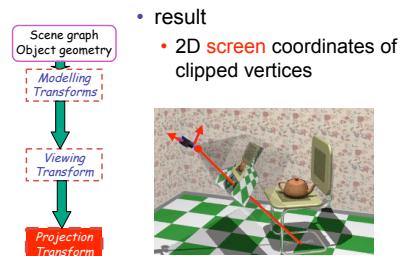

6

## Rendering Pipeline

7

## Rendering Pipeline

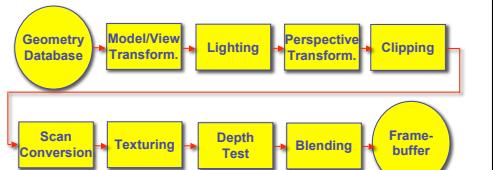

8

## Viewing and Projection

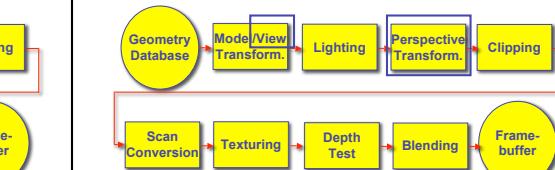

- need to get from 3D world to 2D image
- projection: geometric abstraction
  - what eyes or cameras do
- two pieces
  - viewing transform:
    - where is the camera, what is it pointing at?
  - perspective transform: 3D to 2D
    - flatten to image

## Rendering Pipeline

9

## Rendering Pipeline

10

## OpenGL Transformation Storage

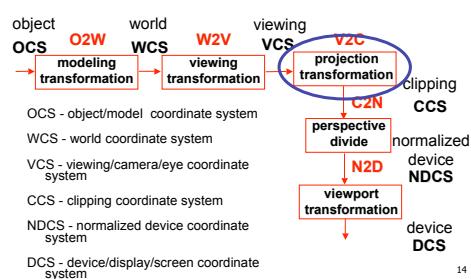

- modeling and viewing stored together
  - possible because no intervening operations
- perspective stored in separate matrix
- specify which matrix is target of operations
  - common practice: return to default modelview mode after doing projection operations

11

## Coordinate Systems

- result of a transformation
- names
  - convenience
    - mouse: leg, head, tail
- standard conventions in graphics pipeline
  - object/modelling
  - world
  - camera/viewing/eye
  - screen/window
  - raster/device

## Projective Rendering Pipeline

13

14

## Projections I

15

## Pinhole Camera

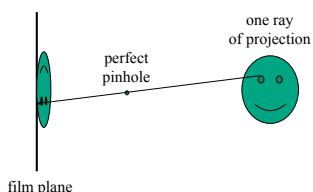

- ingredients
  - box, film, hole punch
- result
  - picture

16

## Pinhole Camera

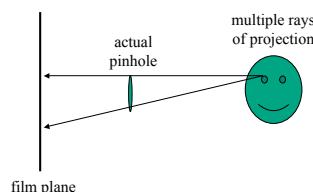

- theoretical perfect pinhole
- light shining through tiny hole into dark space yields upside-down picture

17

## Pinhole Camera

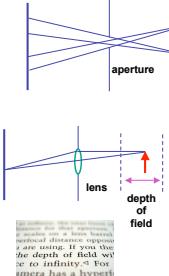

- non-zero sized hole
- blur: rays hit multiple points on film plane

18

## Real Cameras

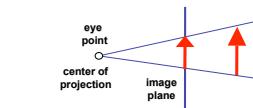

- pinhole camera has small **aperture** (lens opening)
  - minimize blur
- problem: hard to get enough light to expose the film
- solution: lens
  - permits larger apertures
  - permits changing distance to film plane without actually moving it
    - cost: limited depth of field where image is in focus

[http://en.wikipedia.org/wiki/Image\\_DOF-ShallowDepthOfField.jpg](http://en.wikipedia.org/wiki/Image_DOF-ShallowDepthOfField.jpg)

19

## Graphics Cameras

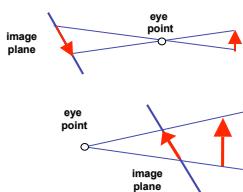

- real pinhole camera: image inverted
- computer graphics camera: convenient equivalent

20

## General Projection

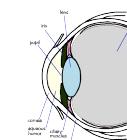

- image plane need not be perpendicular to view plane

21

## Perspective Projection

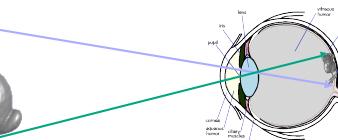

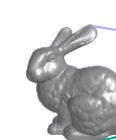

- our camera must model perspective

22

## Perspective Projection

- our camera must model perspective

23

## Projective Transformations

- planar geometric projections
  - planar: onto a plane
  - geometric: using straight lines
  - projections: 3D  $\rightarrow$  2D
- aka projective mappings

24

## Projective Transformations

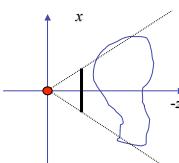

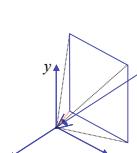

- properties
  - lines mapped to lines and triangles to triangles
  - parallel lines do **NOT** remain parallel
    - e.g. rails vanishing at infinity
- affine combinations are **NOT** preserved
  - e.g. center of a line does not map to center of projected line (perspective foreshortening)

25

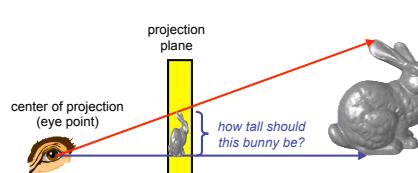

## Perspective Projection

- project all geometry
  - through common center of projection (eye point)
  - onto an image plane

26

## Perspective Projection

27

## Basic Perspective Projection

similar triangles

$$\frac{x'}{d} = \frac{x}{z} \rightarrow x' = \frac{x \cdot d}{z}$$

$$\frac{y'}{d} = \frac{y}{z} \rightarrow y' = \frac{y \cdot d}{z}$$

but  $z' = d$

- nonuniform foreshortening
- not affine

28

## Perspective Projection

- desired result for a point  $[x, y, z, 1]^T$  projected onto the view plane:

$$\frac{x'}{d} = \frac{x}{z}, \quad \frac{y'}{d} = \frac{y}{z}$$

$$x' = \frac{x \cdot d}{z} = \frac{x}{z/d}, \quad y' = \frac{y \cdot d}{z} = \frac{y}{z/d}, \quad z' = d$$

- what could a matrix look like to do this?

29

## Simple Perspective Projection Matrix

$$\begin{bmatrix} \frac{x}{z/d} \\ \frac{y}{z/d} \\ d \end{bmatrix}$$

30

## Simple Perspective Projection Matrix

$$\begin{bmatrix} \frac{x}{z/d} \\ \frac{y}{z/d} \\ \frac{z}{z/d} \\ d \end{bmatrix}$$

is homogenized version of  
where  $w = z/d$

$$\begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix}$$

is homogenized version of  
where  $w = z/d$

$$\begin{bmatrix} x \\ y \\ z \\ z/d \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 1/d & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

31

32

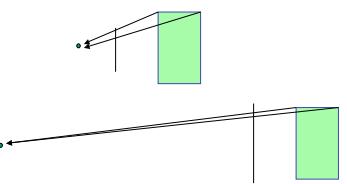

## Perspective Projection

- expressible with 4x4 homogeneous matrix
- use previously untouched bottom row
- perspective projection is irreversible
- many 3D points can be mapped to same ( $x, y, d$ ) on the projection plane
- no way to retrieve the unique z values

33

## Moving COP to Infinity

- as COP moves away, lines approach parallel
- when COP at infinity, orthographic view

34

## Orthographic Camera Projection

- camera's back plane parallel to lens
- infinite focal length
- no perspective convergence

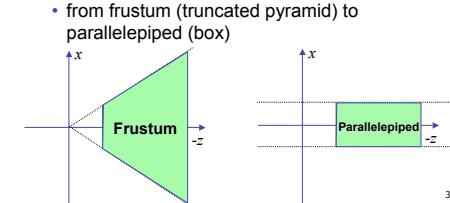

- just throw away z values

$$\begin{bmatrix} x_p \\ y_p \\ z_p \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

35

## Perspective to Orthographic

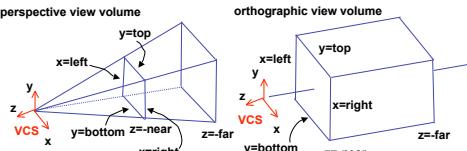

- transformation of space
- center of projection moves to infinity
- view volume transformed

36

## View Volumes

- specifies field-of-view, used for clipping
- restricts domain of  $z$  stored for visibility test

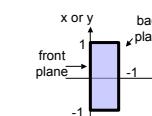

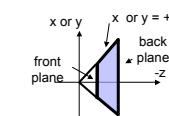

## Demo: Perspective and Ortho Volumes

- Nate Robins tutorial (projection)
  - <http://www.xmission.com/~nate/tutors.html>

## Canonical View Volumes

- standardized viewing volume representation

perspective

orthographic  
orthogonal  
parallel

39

## Why Canonical View Volumes?

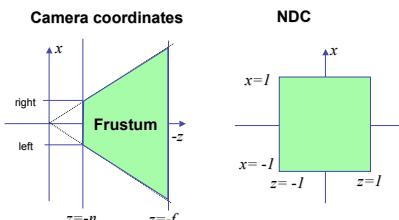

- permits standardization
- clipping
  - easier to determine if an arbitrary point is enclosed in volume with canonical view volume vs. clipping to six arbitrary planes
- rendering
  - projection and rasterization algorithms can be reused

40

## Normalized Device Coordinates

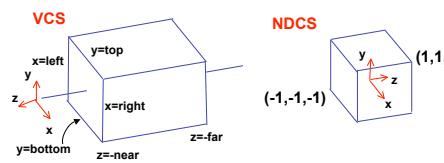

- convention
- viewing frustum mapped to specific parallelepiped
  - Normalized Device Coordinates (NDC)
  - same as clipping coords
- only objects inside the parallelepiped get rendered
- which parallelepiped?
  - depends on rendering system

## Normalized Device Coordinates

left/right  $x = +/- 1$ , top/bottom  $y = +/- 1$ , near/far  $z = +/- 1$ 

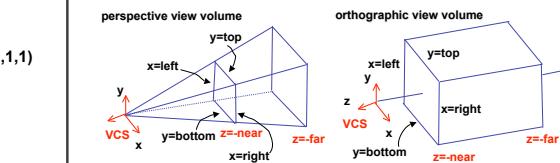

## Understanding Z

- $z$  axis flip changes coord system handedness
  - RHS before projection (eye/view coords)
  - LHS after projection (clip, norm device coords)

near, far always positive in OpenGL calls

```
glOrtho(left,right,bot,top,near,far);
glFrustum(left,right,bot,top,near,far);
glPerspective(fovy,aspect,near,far);
```

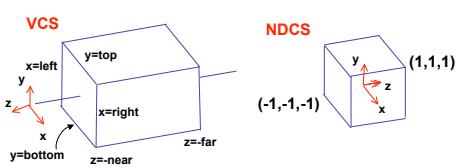

44

## Understanding Z

- why near and far plane?
- near plane:
  - avoid singularity (division by zero, or very small numbers)
- far plane:
  - store depth in fixed-point representation (integer), thus have to have fixed range values (0...1)
  - avoid/reduce numerical precision artifacts for distant objects

## Orthographic Derivation

- scale, translate, reflect for new coord sys

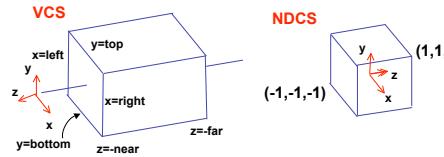

## Orthographic Derivation

- scale, translate, reflect for new coord sys

$$y' = a \cdot y + b \quad y = \text{top} \rightarrow y' = 1 \quad 1 = a \cdot \text{top} + b$$

$$y = \text{bot} \rightarrow y' = -1 \quad -1 = a \cdot \text{bot} + b$$

## Orthographic Derivation

- scale, translate, reflect for new coord sys

$$y' = a \cdot y + b \quad y = \text{top} \rightarrow y' = 1 \quad 1 = a \cdot \text{top} + b$$

$$y = \text{bot} \rightarrow y' = -1 \quad -1 = a \cdot \text{bot} + b$$

$$b = 1 - a \cdot \text{top}, b = -1 - a \cdot \text{bot} \quad 1 = \frac{2}{\text{top} - \text{bot}} \cdot \text{top} + b$$

$$1 - a \cdot \text{top} = -1 - a \cdot \text{bot} \quad b = 1 - \frac{2 \cdot \text{top}}{\text{top} - \text{bot}}$$

$$1 - (-1) = -a \cdot \text{bot} - (-a \cdot \text{top}) \quad b = \frac{(\text{top} - \text{bot}) - 2 \cdot \text{top}}{\text{top} - \text{bot}}$$

$$2 = a(-\text{bot} + \text{top}) \quad a = \frac{2}{\text{top} - \text{bot}}$$

$$a = \frac{2}{\text{top} - \text{bot}} \quad b = \frac{-\text{top} - \text{bot}}{\text{top} - \text{bot}}$$

48

## Orthographic Derivation

- scale, translate, reflect for new coord sys

$$y' = a \cdot y + b \quad y = \text{top} \rightarrow y' = 1 \\ y = \text{bot} \rightarrow y' = -1$$

VCS

$$a = \frac{2}{\text{top} - \text{bot}} \quad b = -\frac{\text{top} + \text{bot}}{\text{top} - \text{bot}}$$

same idea for right/left, far/near

49

## Orthographic Derivation

- scale, translate, reflect for new coord sys

$$P' = \begin{bmatrix} \frac{2}{\text{right} - \text{left}} & 0 & 0 & -\frac{\text{right} + \text{left}}{\text{right} - \text{left}} \\ 0 & \frac{2}{\text{top} - \text{bot}} & 0 & -\frac{\text{top} + \text{bot}}{\text{top} - \text{bot}} \\ 0 & 0 & \frac{-2}{\text{far} - \text{near}} & -\frac{\text{far} + \text{near}}{\text{far} - \text{near}} \\ 0 & 0 & 0 & 1 \end{bmatrix} P$$

50

## Orthographic Derivation

- scale, translate, reflect for new coord sys

$$P' = \begin{bmatrix} 2 & 0 & 0 & -\frac{\text{right} + \text{left}}{\text{right} - \text{left}} \\ 0 & 2 & 0 & -\frac{\text{top} + \text{bot}}{\text{top} - \text{bot}} \\ 0 & 0 & -2 & -\frac{\text{far} + \text{near}}{\text{far} - \text{near}} \\ 0 & 0 & 0 & 1 \end{bmatrix} P$$

51

## Orthographic Derivation

- scale, translate, reflect for new coord sys

$$P' = \begin{bmatrix} \frac{2}{\text{right} - \text{left}} & 0 & 0 & -\frac{\text{right} + \text{left}}{\text{right} - \text{left}} \\ 0 & \frac{2}{\text{top} - \text{bot}} & 0 & -\frac{\text{top} + \text{bot}}{\text{top} - \text{bot}} \\ 0 & 0 & \frac{-2}{\text{far} - \text{near}} & -\frac{\text{far} + \text{near}}{\text{far} - \text{near}} \\ 0 & 0 & 0 & 1 \end{bmatrix} P$$

52

## Orthographic Derivation

- scale, translate, reflect for new coord sys

$$P' = \begin{bmatrix} \frac{2}{\text{right} - \text{left}} & 0 & 0 & -\frac{\text{right} + \text{left}}{\text{right} - \text{left}} \\ 0 & \frac{2}{\text{top} - \text{bot}} & 0 & -\frac{\text{top} + \text{bot}}{\text{top} - \text{bot}} \\ 0 & 0 & \frac{-2}{\text{far} - \text{near}} & -\frac{\text{far} + \text{near}}{\text{far} - \text{near}} \\ 0 & 0 & 0 & 1 \end{bmatrix} P$$

53

## Orthographic OpenGL

```
glMatrixMode(GL_PROJECTION);
glLoadIdentity();
glOrtho(left,right,bot,top,near,far);
```

54

## Demo

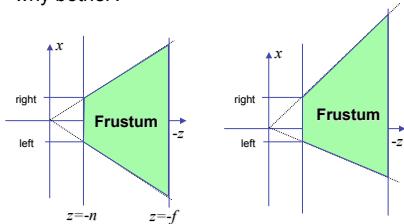

- Brown applets: viewing techniques
  - parallel/orthographic camera transformations
- [http://www.cs.brown.edu/exploratories/freeSoftware/catalogs/viewing\\_techniques.html](http://www.cs.brown.edu/exploratories/freeSoftware/catalogs/viewing_techniques.html)

## Projections II

55

## Asymmetric Frusta

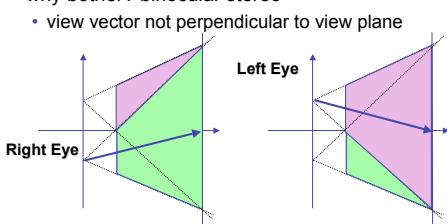

- our formulation allows asymmetry
- why bother?

57

## Asymmetric Frusta

- our formulation allows asymmetry
- why bother? binocular stereo
  - view vector not perpendicular to view plane

58

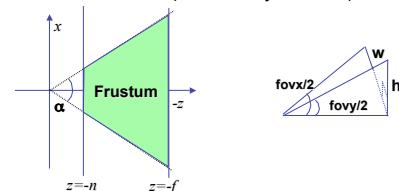

## Simpler Formulation

- left, right, bottom, top, near, far
  - nonintuitive
  - often overkill
- look through window center
  - symmetric frustum
- constraints
  - left = -right, bottom = -top

59

## Field-of-View Formulation

- FOV in one direction + aspect ratio (w/h)
  - determines FOV in other direction
  - also set near, far (reasonably intuitive)

60

## Perspective OpenGL

```
glMatrixMode(GL_PROJECTION);
glLoadIdentity();

glFrustum(left,right,bot,top,near,far);
or
glPerspective(fovy,aspect,near,far);
```

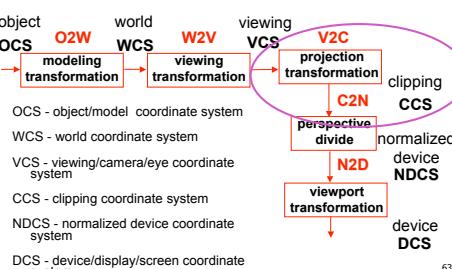

61

## Demo: Frustum vs. FOV

- Nate Robins tutorial (take 2):
  - <http://www.xmission.com/~nate/tutors.html>

62

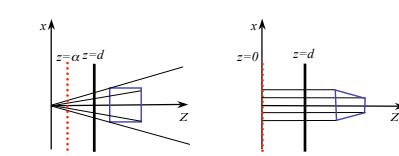

## Projective Rendering Pipeline

63

## Projection Normalization

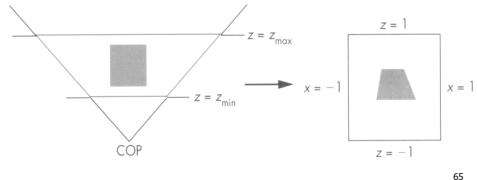

- warp perspective view volume to orthogonal view volume
  - render all scenes with orthographic projection!
  - aka perspective warp

64

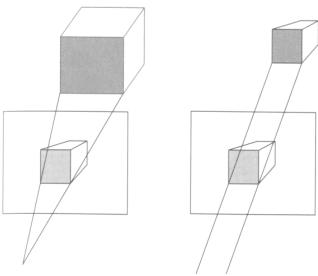

## Perspective Normalization

- perspective viewing frustum transformed to cube
- orthographic rendering of cube produces same image as perspective rendering of original

65

## Predistortion

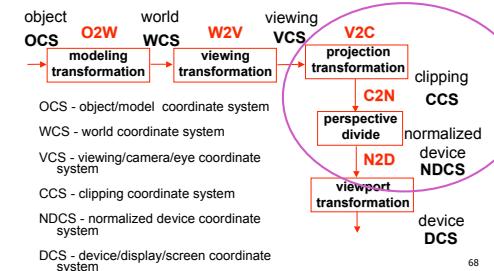

66

## Demos

- Tuebingen applets from Frank Hanisch
  - <http://www.gris.uni-tuebingen.de/projects/grdev/doc/html/etc/AppletIndex.html#Transformationsen>

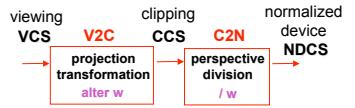

67

## Projective Rendering Pipeline

68

## Separate Warp From Homogenization

- warp requires only standard matrix multiply
  - distort such that orthographic projection of distorted objects is desired persp projection
    - $w$  is changed
  - clip after warp, before divide
  - division by  $w$ : homogenization

69
