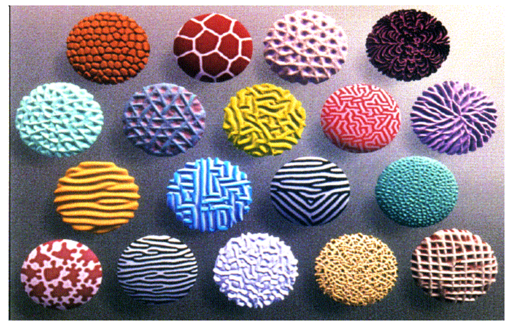
TEXTURE MAPPING

TEXTURE MAPPING

- real life objects have nonuniform colors, normals
- to generate realistic objects, reproduce coloring & normal variations = **texture**
- can often replace complex geometric details



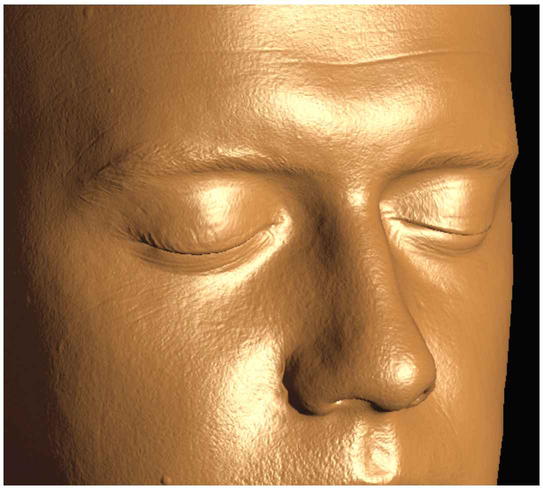
TEXTURE MAPPING

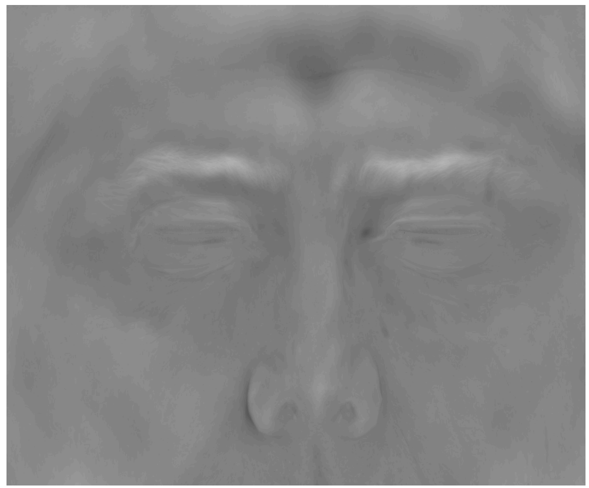
- hide geometric simplicity
  - images convey illusion of geometry
  - map a brick wall texture on a flat polygon
  - create bumpy effect on surface

- usually: 2D information associated with a 3D surface
  - point on 3D surface $\leftrightarrow$ point in2D texture
  - typically r,g,b colors
  - but can be any attributes that you would like to model over a surface

BUMP MAPS

2D texture maps that are used to model the appearance of surface bumps, by adding small perturbations to the surface normals. The rendered geometry does not actually have bumps, i.e., it is smooth !!

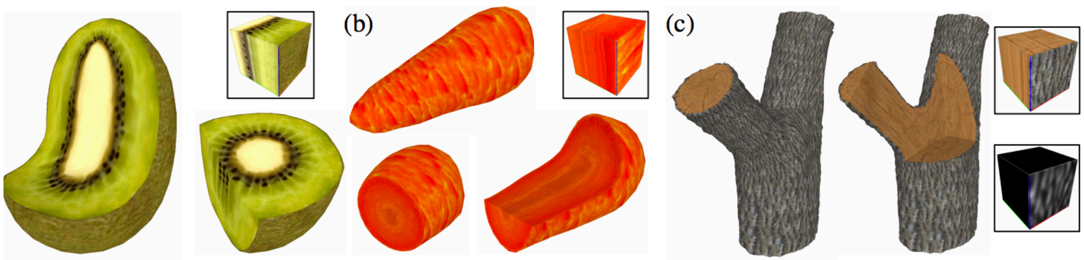




threejs.org: materials/bumpmap

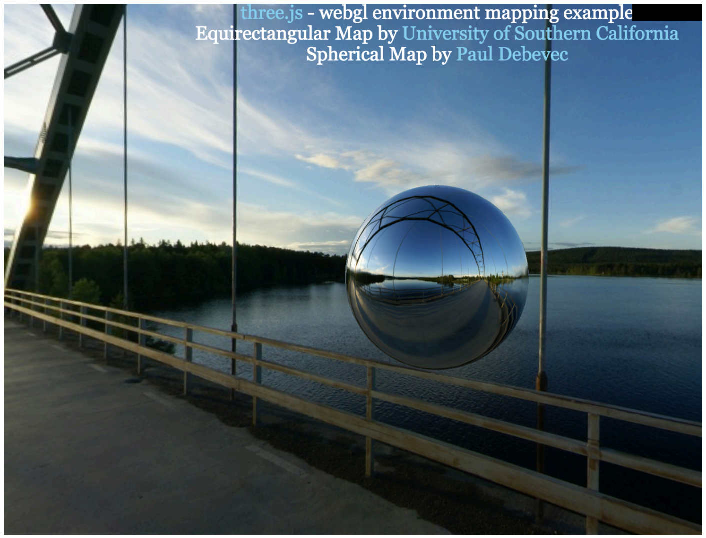
VOLUMETRIC TEXTURES

- model r,g,b for every point in a volume
- often computed using procedural function



[Lapped Solid Textures, SIGGRAPH 2008]

ENVIRONMENT MAP

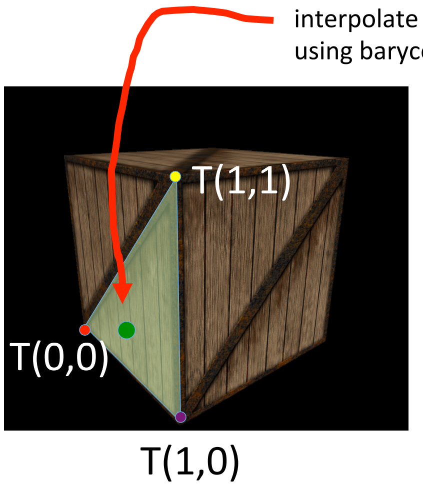


There is an invisible corner seam in this image!

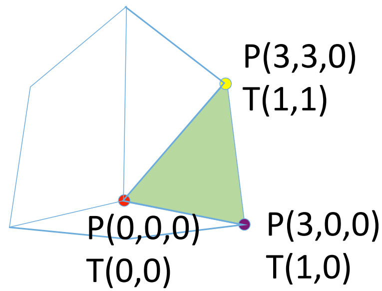
2 of 6 images for a cube map;
as a viewer, you are inside this cube!

BASIC TEXTURE MAP

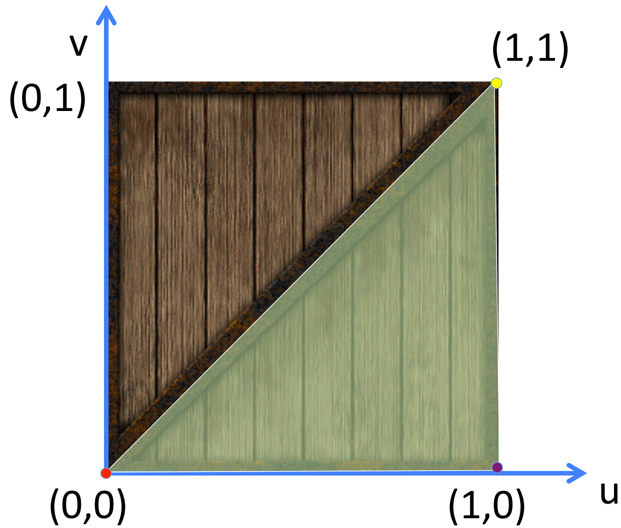
interpolate (u,v) from vertices
using barycentric coordinates



rendered image

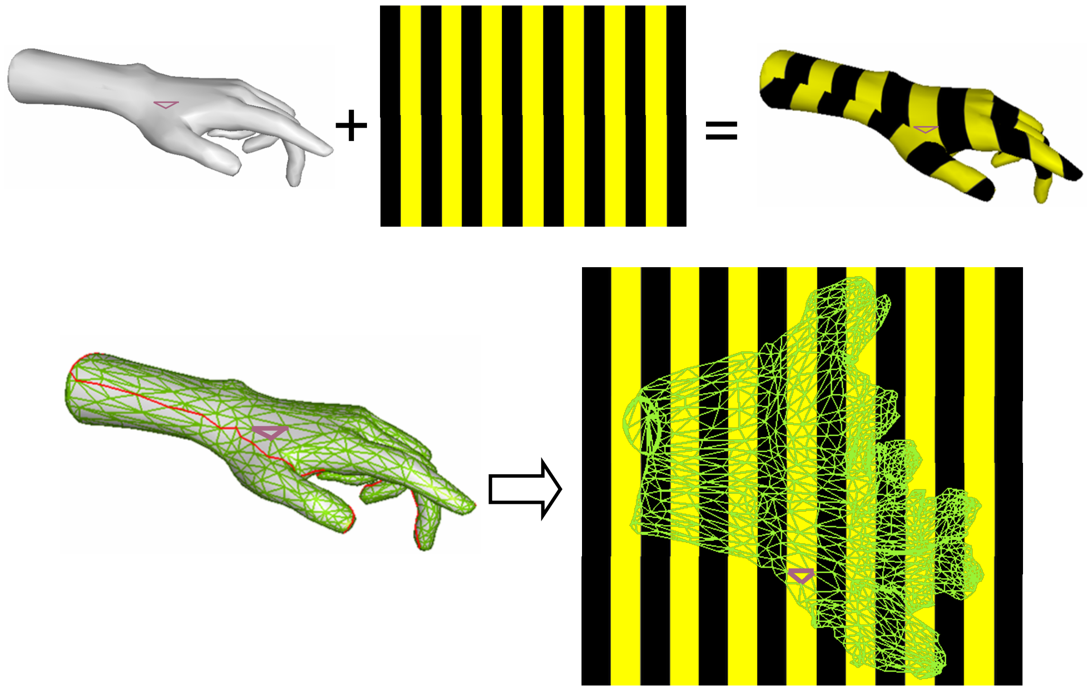


3D model:
u,v texture coodinates
are assigned to vertices
by artist or program.



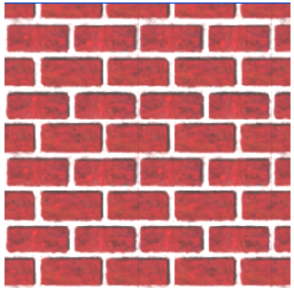
2D texture map: Image
Pixels here are called “texels”

TEXTURE MAPPING EXAMPLE



TEXTURE LOOKUP: TILING AND CLAMPING

- What if s or t is outside [0…1] ?
- Multiple choices, e.g.:
  - tex1.wrapS = THREE.RepeatWrapping
  - tex1.wrapS = THREE.ClampToEdgeWrapping
  - tex1.wrapS = THREE.MirroredRepeatWrapping



TEXTURES: VERTEX SHADER & FRAGMENT SHADER

- javascript: texture is passed as a “uniform” to the fragment shader: (slightly more complex than this due to async image load in js)

```
var myTexture = new THREE.TextureLoader().load( 'textures/crate.gif' );
myTexture.wrapS = THREE.RepeatWrapping;
var material = new THREE.MeshBasicMaterial( { map: myTexture } );
```

- vertex shader

```
attribute vec2 uv;
varying vec2 uvCoords;
uvCoords = uv;
```

- Fragment Shader:

```
uniform sampler2D myTexture;
varying vec2 uvCoords;
vec4 texColor = texture2D(myTexture, uvCoords);
gl_FragColor = texColor;
```

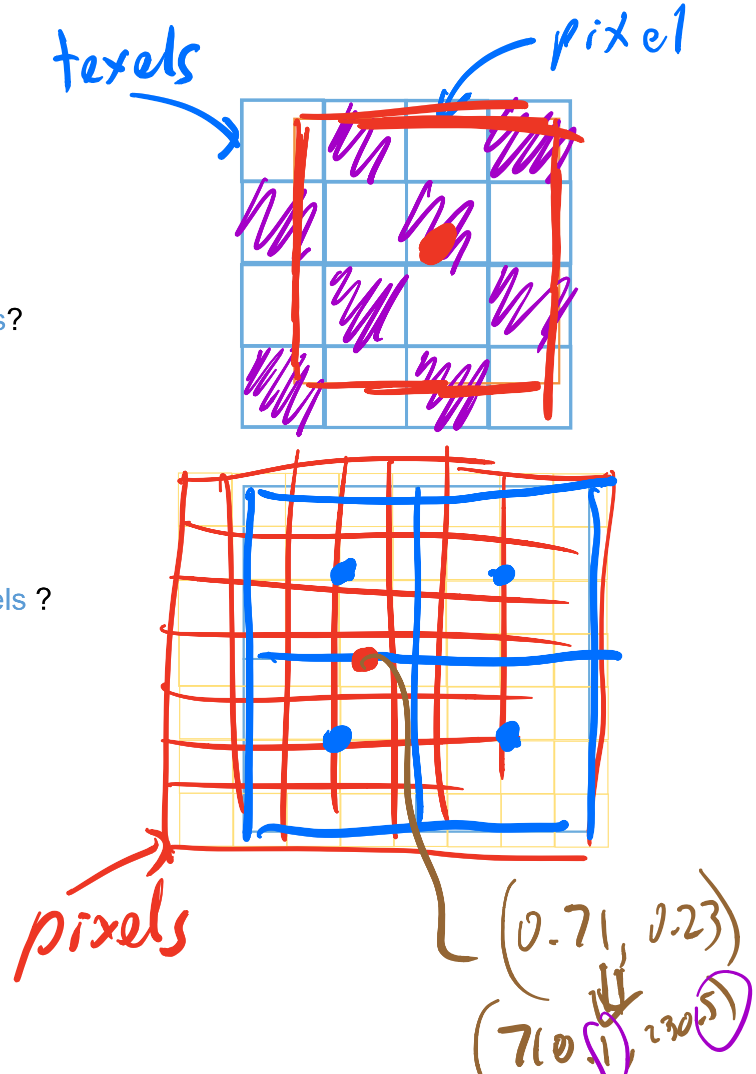
RECONSTRUCTION

- how to deal with:
  - pixels that are much larger than texels?
    - minification

```
THREE.NearestFilter
THREE.NearestMipMapNearestFilter
THREE.NearestMipMapLinearFilter
THREE.LinearFilter
THREE.LinearMipMapNearestFilter
THREE.LinearMipMapLinearFilter
```

  - pixels that are much smaller than texels ?
    - magnification

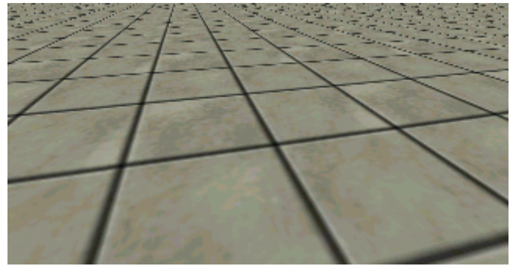
```
THREE.NearestFilter
THREE.LinearFilter
```



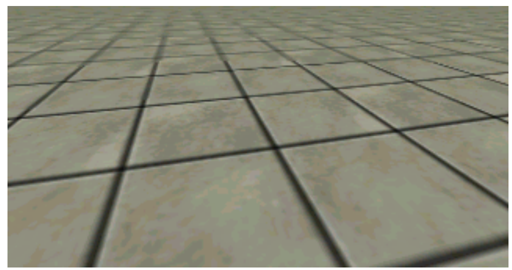
MIPMAPPING

use "image pyramid" to precompute averaged versions of the texture

2x2



Without MIP-mapping



With MIP-mapping

Idea: Precompute and store results that can approximate the desired sums/integrals/averages.

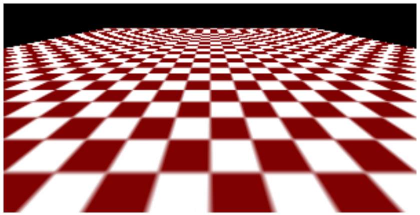
MIPMAPS

- "**multum in parvo**" -- many things in a small place
  - prespecify a series of prefiltered texture maps of decreasing resolutions
  - requires more texture storage
  - avoid shimmering and flashing as objects move

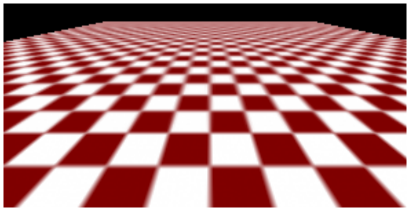
e.g.:

```
texture.magFilter = THREE.NearestFilter;
texture.minFilter THREE.LinearMipMapLinearFilter;
```

without

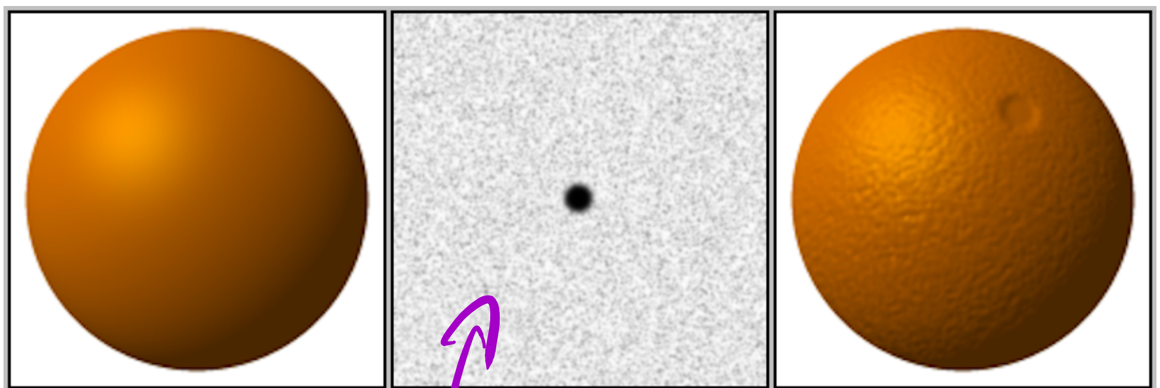


with



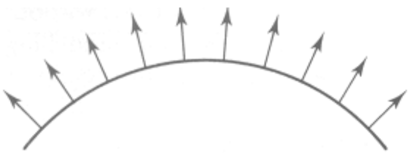
BUMP MAPPING: NORMALS AS TEXTURE

- object surface often not smooth – to recreate correctly need complex geometry model
- can control shape “effect” by locally perturbing surface normal
  - random perturbation
  - directional change over region



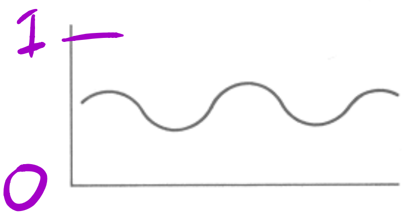
Bump map : gray-scale image that virtually offsets the surface in the direction $\vec{N}$

BUMP MAPPING



$O(u)$

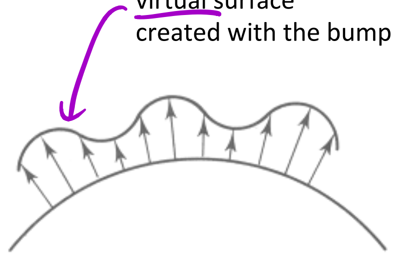
Original surface

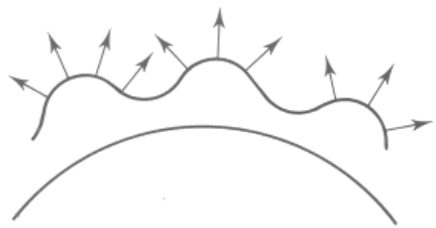


$B(u)$

A bump map

virtual surface
created with the bump map





normals corresponding to this
virtual surface

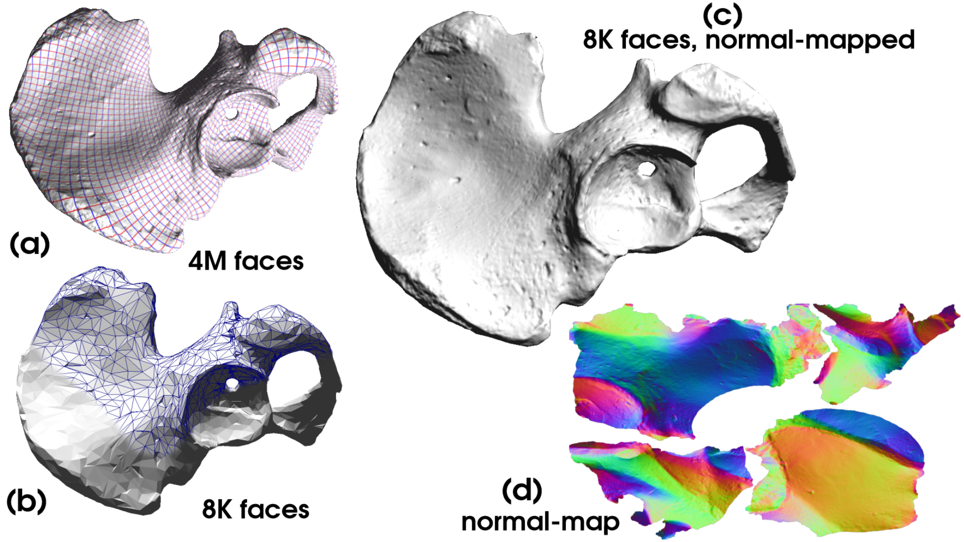
- can compute using cross-product of vectors from finite differences

(specific details not covered in this class)

$\vec{N} \in \mathbb{R}^3$ for every point on a surface, much like a texture map defines a color for each point.

1D offset along $\vec{N}$

Normal/Bump mapping

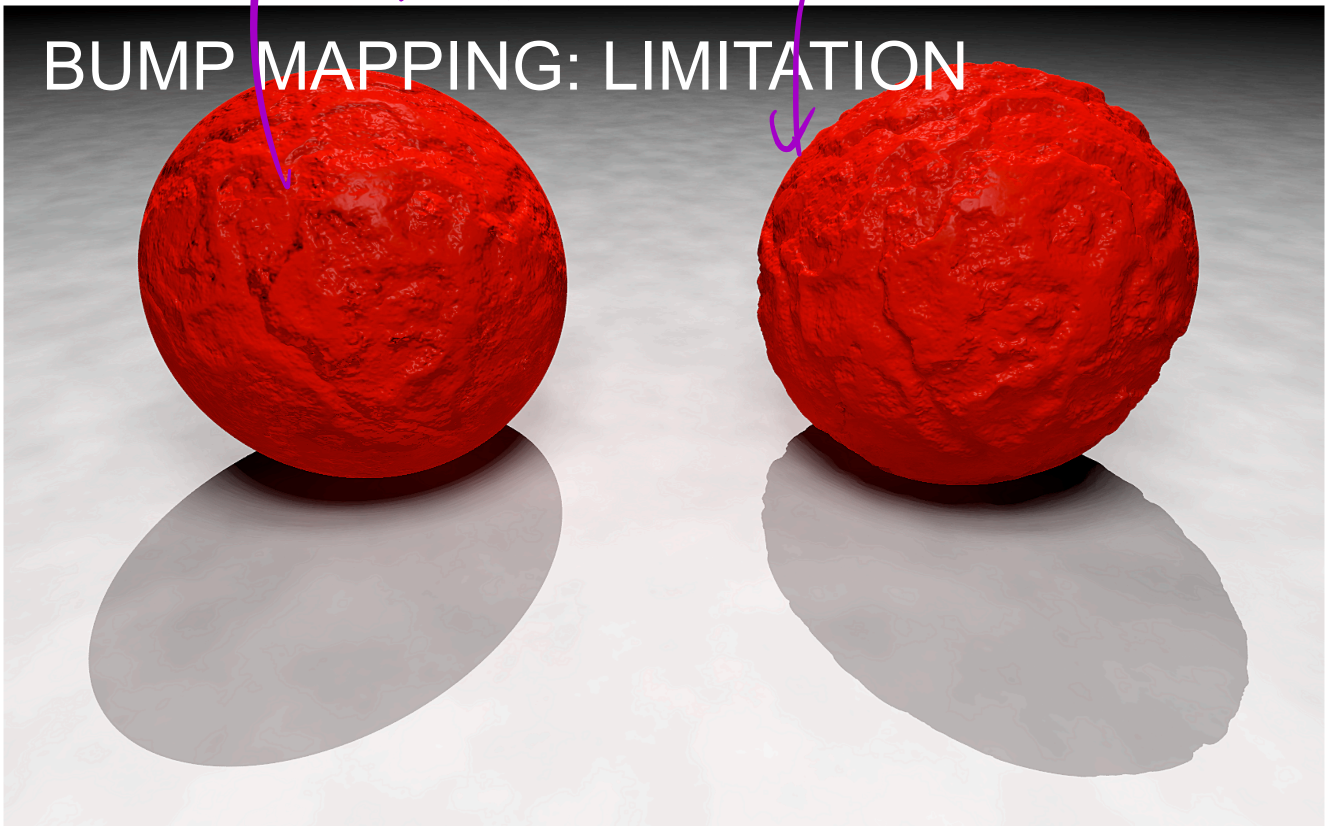


(one detail we will skip: the most common form of normal maps define normals in a surface-relative coordinate frame, defined by $(\vec{T}, \vec{B}, \vec{N})$ where $\vec{N}$ = surface normal, $\vec{T}$ = tangent, $\vec{B}$ = bitangent)

Bump map
smooth silhouette

Displacement map
rough silhouette

BUMP MAPPING: LIMITATION

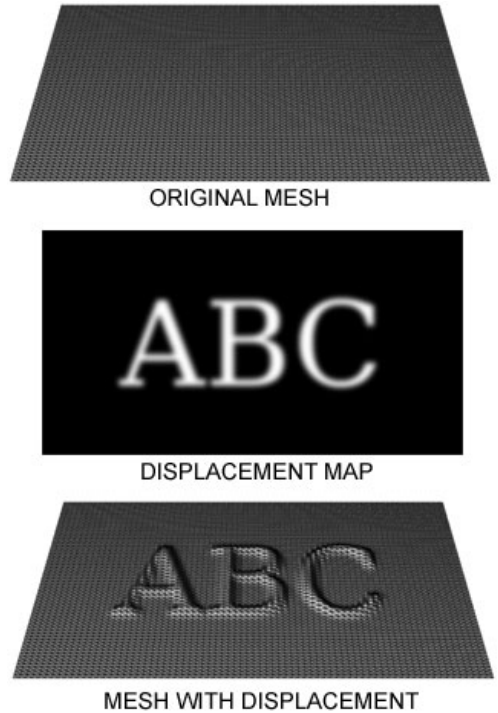


- changed geometry
in tesselation shader

DISPLACEMENT MAPPING

- bump mapping gets silhouettes wrong
    - shadows wrong too

- change surface geometry instead
    - need to subdivide surface
    - use tesselation shader



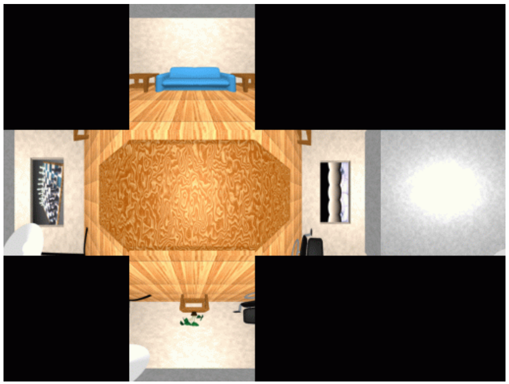
https://en.wikipedia.org/wiki/Displacement_mapping#/media/

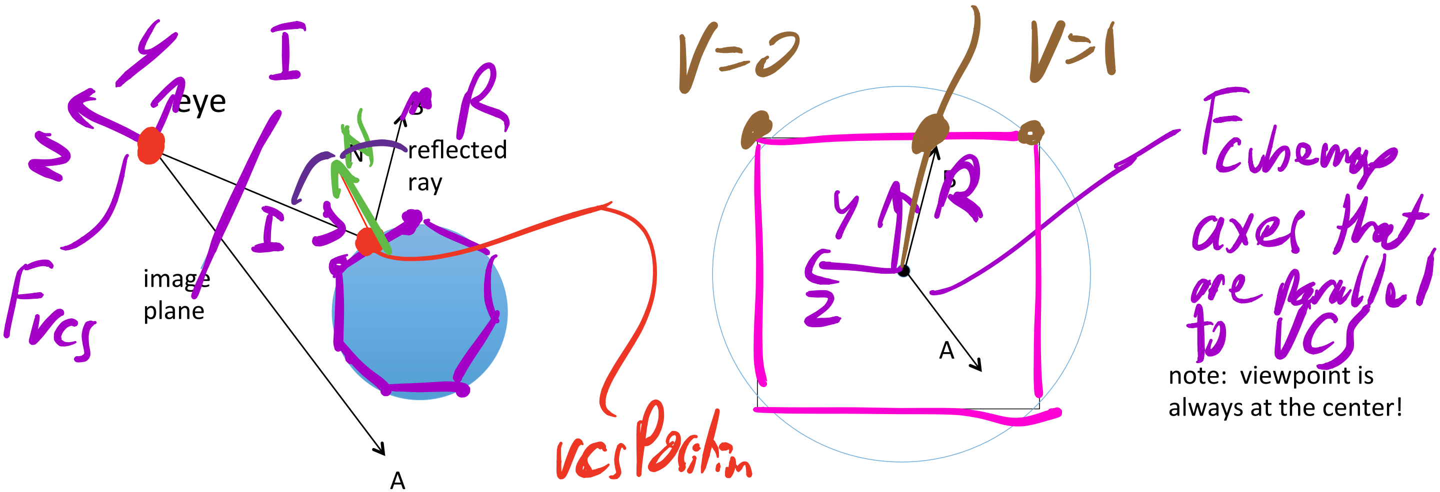
ENVIRONMENT MAPPING

- generate image of surrounding or reflection
- sphere map or   cube map

CUBE MAP

- 6 planar textures, sides of cube
  - point camera in 6 different directions, facing out from origin

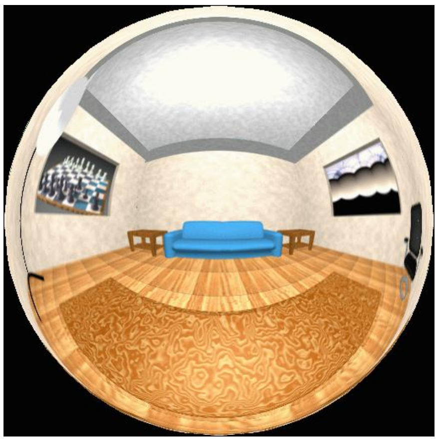




- Cube map: direction of vector selects the face of the cube to be indexed
  - co-ordinate with largest magnitude
    - e.g., the vector (-0.2, 0.5, -0.84) selects the –Z face
  - remaining two coordinates select the pixel from the face.

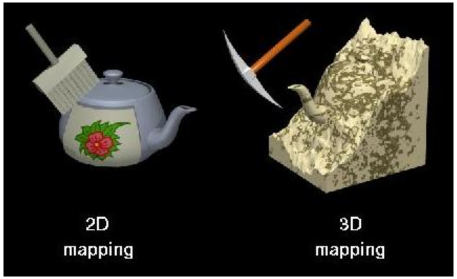
SPHERE MAP

- texture is distorted fish-eye view
  - point camera at mirrored sphere
  - spherical texture mapping creates texture coordinates that correctly index into this texture map



VOLUMETRIC TEXTURE

- define texture pattern over 3D domain - 3D space containing the object
- texture function can be digitized or procedural
- for each point on object compute texture from point location in space
- e.g., ShaderToy
- computation often cheaper than memory access



PROCEDURAL TEXTURES: PERLIN NOISE

- several good explanations
  - http://www.noisemachine.com/talk1
  - http://freespace.virgin.net/hugo.elias/models/m_perlin.htm
