## Degree Elevation and Continuity

© Alla Sheffer & Wolfgang Heidrich

**Midterm date: October 7**

***Material: Curves***

© Alla Sheffer & Wolfgang Heidrich

## Clicker Question

*Can a circle be described using an explicit representation?*

**A. Yes**

**B. No**

© Alla Sheffer & Wolfgang Heidrich

## Syllabus

### *Curves in 2D and 3D*

- Implicit vs. Explicit vs. Parametric curves
- Bézier curves, de Casteljau algorithm
- **Bézier subdivision, degree elevation**
- **Continuity**, B-Splines
- Subdivision Curves

### *Properties of Curves and Surfaces*

### *Surfaces*

© Alla Sheffer & Wolfgang Heidrich

## De Casteljau Algorithm, Again

**Evaluation scheme (cubic case,  $t=1/2$ ):**

© Alla Sheffer & Wolfgang Heidrich

## Observation

**De Casteljau generates 2 new control polygons!**

- For parameter interval  $[0, 1/2]$ , and  $[1/2, 1]$
- Can be used to recursively subdivide control polygon
- Can you prove it?

© Alla Sheffer & Wolfgang Heidrich

## Subdivision Example

**Cubic case:**

© Alla Sheffer & Wolfgang Heidrich

## Subdivision Algorithm

**Algorithm:**

- Recursively subdivide control polygon at center of parameter interval
- Resulting control polygons converge to actual curve

**Theorem (proof in book, Section 5.2): :**

- Convergence is very fast
  - for  $n$  subdivision steps, the error (maximum distance between control polygons and curve) is

$$\varepsilon < \frac{c}{2^n}$$

for some constant  $c$

## Derivatives of Bézier Curves

### **Theorem (proof on board):**

- The derivative of a Bézier curve

$$F(t) := \sum_{i=0}^m B_i^m(t) \cdot \mathbf{b}_i$$

is given as

$$F'(t) := m \cdot \sum_{i=0}^{m-1} B_i^{m-1}(t) \cdot (\mathbf{b}_{i+1} - \mathbf{b}_i)$$

© Alla Sheffer & Wolfgang Heidrich

## Derivatives on Bézier Curves

### **Note:**

- In particular, derivative can itself be interpreted as Bézier curve
- Control “points” of this “curve” are really vectors (directions)
- With this theorem we have finally shown that a Bézier curve is tangential in the control polygon at its first and last vertex.

© Alla Sheffer & Wolfgang Heidrich

## Problem: how to describe long curves?

**Using high-order Bezier curve = approximation quality diminishes**

© Alla Sheffer & Wolfgang Heidrich

## Splines

### **Concept:**

- Provide local control by piecing together multiple (polynomial) curves in smooth fashion
- This is called Spline
- Like with polynomial curves there are multiple representations, e.g.:
  - *Hermite Spline (week 2)*
  - *B-Spline (next lecture?)*

© Alla Sheffer & Wolfgang Heidrich

## Splines in power point

© Alla Sheffer & Wolfgang Heidrich

## Splines

### **Problem:**

- How do we ensure **smooth** (continuous) transition between segments?

### **Several approaches:**

- Use Bézier curves, but restrict location of some control points
  - *User has to do “The Right Thing”™*
    - (can be made transparent)
- Use representation in which continuity is implicitly guaranteed
  - *B-Splines*

© Alla Sheffer & Wolfgang Heidrich

## Continuity

### **Tangent Vector of Parametric Curve:**

- Given by its derivative (here: 3D):

$$T(t) = F'(t) = \begin{pmatrix} dx/dt \\ dy/dt \\ dz/dt \end{pmatrix}$$

- Example (2D explicit curve):

$$F(t) := \begin{pmatrix} t \\ t^2 \end{pmatrix} \quad T(t) := F'(t) = \begin{pmatrix} 1 \\ 2t \end{pmatrix}$$

© Alla Sheffer & Wolfgang Heidrich

## Continuity

### **Note:**

- This is a tangent vector, not a tangent direction
- This vector has a length
  - *Represents speed of an object moving along the curve*

© Alla Sheffer & Wolfgang Heidrich

## Continuity

### Def:

- A curve  $F(t)$  is called  $C^k$ -continuous if its  $k^{\text{th}}$  derivative  $F^{(k)}(t)$  exists (i.e. is continuous) everywhere

### Note:

- Polynomial curves are infinitely continuous

### Def:

- Two curve segments  $F(t)$  defined over  $[t, t_0]$  and  $G(t)$  defined over  $[t_0, t']$  are called  $C^k$ -continuous at  $t_0$  if their first  $k$  derivatives match at  $t_0$ 
  - Definition extends to cases with “shifted” parameter intervals  $F(t)$  and  $G(t)$  are called  $C^k$ -continuous if at first  $k$  derivatives of  $F(t)$  at  $t_0$  match first  $k$  derivatives of  $G(t)$  at  $t_1$

© Alla Sheffer & Wolfgang Heidrich

## Continuity

### Examples:

- $C^0$ -continuous:  $F(t_0) = G(t_0)$ 
  - i.e. the curves meet in one point for the same parameter value
- $C^1$ -continuous:  $F(t_0) = G(t_0)$  and  $F'(t_0) = G'(t_0)$ 
  - They meet and have the same tangent vector
  - Note: both direction and length of vector are important!
- $C^2$ -continuous: in addition  $F''(t_0) = G''(t_0)$ 
  - Curvatures match as well
- ...

## C1 and C2 continuity

© Alla Sheffer & Wolfgang Heidrich

## Bezier Continuity

- $C^0$  : share end control points  $b_m = b'_0$
- $C^1$  :  $b_m - b_{m-1} = b'_1 - b'_0$
- $G^1$  :  $b_m - b_{m-1}$  collinear to  $b'_1 - b'_0$

© Alla Sheffer & Wolfgang Heidrich

## Examples (on board)

© Alla Sheffer & Wolfgang Heidrich

## Continuity Between Bézier Curves

### **Remarks:**

- For  $C^k$  – continuity, the first  $(k+1)$  control points of  $G(t)$  are fixed
  - *Given as affine combinations of the control points of  $F(t)$*
  - *NOT: convex combinations*
    - ▶ There will be coefficients  $>1$  and  $<0$
    - ▶ Extrapolation rather than interpolation
